

## Catch Basin Overview

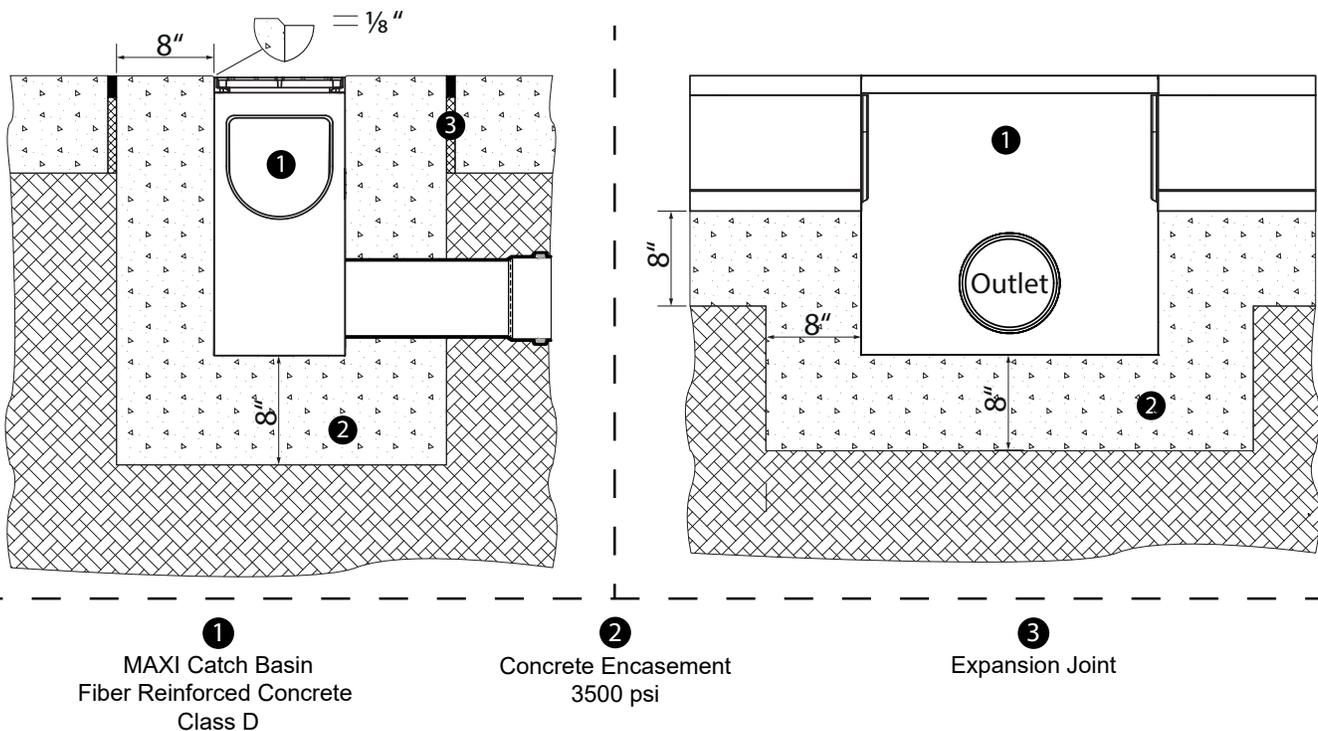

### Product Description

Catch basins are designed to increase flow capacity of the system and filter out larger debris. Catch Basins have the same integral edge rails as their corresponding system channels and include a debris basket. Catch Basins can be positioned anywhere within the run of trench drain and can even be used as a stand-alone drainage structure.

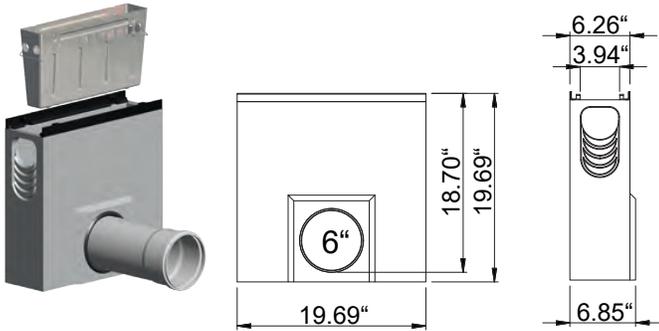

All catch basins meet the same load rating capabilities of the drainage channels and can be stacked to further increase the hydraulic flow rates through greater storage capacity.
