Upflow/Horizontal Left and Downflow/Horizontal Right, Gas-Fired, Direct/Non-Direct Vent, Variable Speed, Modulating, Condensing, Communicating Furnaces

*UHMB060CCV3VA *DHMB060CCV3VA *UHMB080CCV3VA *DHMB080CCV3VA *UHMC100CCV4VA *DHMC100CCV4VA *UHMD120CCV5VA *DHMD120CCV5VA

Note: * First letter may be "A" or "T"

This furnace can be configured for Communicating or 24 VAC modes.

Note: "Graphics in this document are for representation only. Actual model may differ in appearance."

A WARNING

FIRE HAZARD!

Failure to follow this Warning could result in property damage, severe personal injury, or death.

This Warning applies to installations with a flammammable refrigeration system. The furnace must be powered except for service. The furnace shall be installed and connected according to installation instructions and wiring diagrams that are provided with the evaporator coil.

Note: This furnace can only be applied with a flammable refrigerant system when it is setup in 24 volt mode.

A SAFETY WARNING

Only qualified personnel should install and service the equipment. The installation, starting up, and servicing of heating, ventilating, and air-conditioning equipment can be hazardous and requires specific knowledge and training. Improperly installed, adjusted or altered equipment by an unqualified person could result in death or serious injury. When working on the equipment, observe all precautions in the literature and on the tags, stickers, and labels that are attached to the equipment.

IMPORTANT - This document contains a wiring diagram and service information. This is customer property and is to remain with this unit. Please return to service information pack upon completion of work.

WARNING **DISCONNECT POWER BEFORE SERVICING**

- ① Central Furnace heating designs are certified to ANSI Z21.47 / CSA 2.3.
- For U.S. applications, above input ratings (BTUH) are up to 2,000 feet, derate 4% per 1,000 feet for elevations above 2,000 feet above sea level.
 For Canadian applications, above input ratings (BTUH) are up to 4,500 feet, derate 4% per 1,000 feet for elevations above 4,500 feet above sea level.
 Based on U.S. government standard tests.
- (a) The above wiring specifications are in accordance with National Electrical Code; however, installations must comply with local codes.
- § Furnace ships in natural gas configuration. The LP conversions kit used with the modulating furnace is BAYLPSS220B or BAYLPKT220B.
- 6 EnergyStar
- Check motor nameplate for actual FLA

NOTE:

This furnace can be configured for Communicating or 24 VAC modes. Using fully Communicating or 24 VAC modes, the furnace can support single or multi stage heat pump, AC, or heating only applications. Combined with a communicating Comfort Control only, the furnace will support a single stage 24 VAC cooling outdoor unit only.

ENERGY EFFICIENT OPERATION

Furnace is certified to leak 2% or less of nominal air conditioning CFM delivered when pressurized to .5" water column with all inlets, outlets, and drains sealed.

NOTE:

CONTINUOUS fan mode during COOLING operation may not be appropriate in humid climates. If the indoor air exceeds 60% relative humidity or simply feels uncomfortably humid, it is recommended that the fan only be used in the AUTO mode.

A communicating comfort control will disable a continuous fan call if the relative humidity exceeds the set point. See the Troubleshooting Information section of the Communicating Comfort Control Installer's Guide for details.

SAFETY SECTION

WARNING

CARBON MONOXIDE POISONING HAZARD

Failure to follow the steps outlined below for each appliance connected to the venting system being placed into operation could result in carbon monoxide poisoning or death.

The following steps shall be followed for each appliance connected to the venting system being placed into operation, while all other appliances connected to the venting system are not in operation:

- 1. Seal any unused openings in the venting system.
- Inspect the venting system for proper size and horizontal pitch, as required in the National Fuel Gas Code, ANSI Z223.1/NFPA 54 or the CAN/CGA B149 Installation Codes and these instructions. Determine that there is no blockage or restriction, leakage, corrosion and other deficiencies which could cause an unsafe condition.
- As far as practical, close all building doors and windows and all doors between the space in which the appliance(s) connected to the venting system are located and other deficiencies which could cause an unsafe condition.
- 4. Close fireplace dampers.
- Turn on clothes dryers and any appliance not connected to the venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they are operating at maximum speed. Do not operate a summer exhaust fan.
- Follow the lighting instructions. Place the appliance being inspected into operation. Adjust the thermostat so appliance is operating continuously.
- If improper venting is observed during any of the above tests, the venting system must be corrected in accordance with the National Fuel Gas Code, ANSI Z221.1/NFPA 54 and/or CAN/CGA B149 Installation Codes.
- 8. After it has been determined that each appliance connected to the venting system properly vents where tested as outlined above, return doors, windows, exhaust fans, fireplace dampers and any other gas-fired burning appliance to their previous conditions of use.

WARNING

The cabinet must have an uninterrupted or unbroken ground according to National Electrical Code, ANSI/NFPA 70 – "latest edition" and Canadian Electrical Code, CSA C22.1 or local codes to minimize personal injury if an electrical fault should occur.

Failure to follow this warning could result in an electrical shock, fire, injury, or death.

WARNING

CARBON MONOXIDE POISONING HAZARD

Failure to follow the installation instructions for the venting system being placed into operation could result in carbon monoxide poisoning or death.

WARNING

FIRE OR EXPLOSION HAZARD

Failure to follow the safety warnings exactly could result in serious injury, death or property damage.

Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections. A fire or explosion may result causing property damage, personal injury, or loss of life.

WARNING

FIRE OR EXPLOSION HAZARD

Failure to follow the safety warnings exactly could result in serious injury, death or property damage. Improper servicing could result in dangerous operation, serious injury, death, or property damage.

WARNING

BODILY INJURY CAN RESULT FROM HIGH VOLTAGE ELECTRICAL COMPONENTS, FAST MOVING FANS, AND COMBUSTIBLE GAS. FOR PROTECTION FROM THESE INHERENT HAZARDS DURING INSTALLATION AND SERVICING, THE ELECTRICAL SUPPLY MUST BE DISCONNECTED AND THE MAIN GAS VALVE MUST BE TURNED OFF. IF OPERATING CHECKS MUST BE PERFORMED WITH THE UNIT OPERATING, IT IS THE TECHNICIAN'S RESPONSIBILITY TO RECOGNIZE THESE HAZARDS AND PROCEED SAFELY.

WARNING

Should overheating occur, or the gas supply fail to shut off, shut off the Gas Valve to the unit before shutting off the electrical supply.

Failure to follow this warning could result in property damage, personal injury, or death.

A CAUTION

The integrated furnace control is polarity sensitive. The hot leg of the 115 VAC power must be connected to the BLACK field lead

NOTE:

CONTINUOUS fan mode during COOLING operation may not be appropriate in humid climates. If the indoor air exceeds 60% relative humidity or simply feels uncomfortably humid, it is recommended that the fan only be used in the AUTO mode.

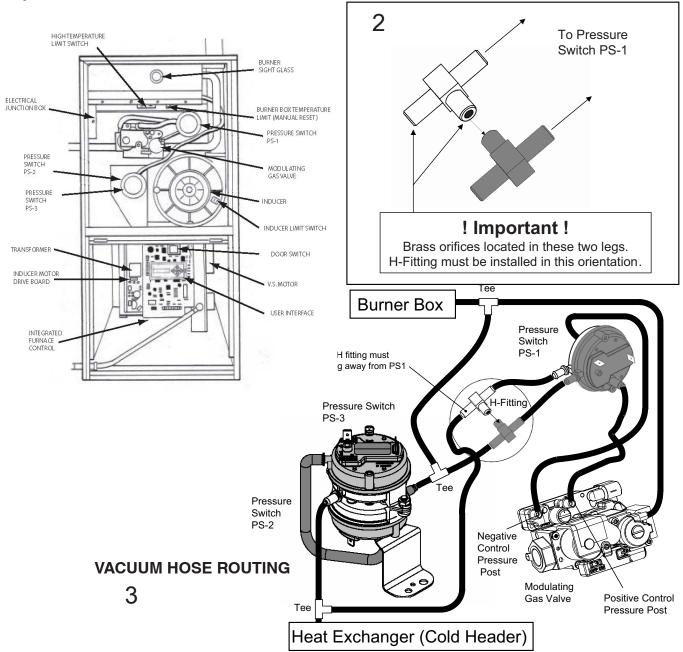

A communicating comfort control will disable a continuous fan call if the relative humidity exceeds the set point. See the Troubleshooting Information section of the Communicating Comfort Control Installer's Guide for details.

WARNING

FIRE – EXPLOSION HAZARD
DO NOT RUN FLEXIBLE GAS LINE THROUGH THE
FURNACE CABINET WALL OR WITHIN THE FURNACE CABINET. FAILURE TO FOLLOW THIS WARNING
COULD RESULT IN PROPERTY DAMAGE, SERIOUS
PERSONAL INJURY, OR DEATH.

FURNACE COMPONENTS

1

Service procedure to access the User Interface for the Modulating Furnace

This procedure must only be performed by trained service personnel.

WARNING

ELECTRICAL SHOCK HAZARD

DO NOT BYPASS THE DOOR SWITCH BY ANY PER-MANENT MEANS.

FAILURE TO FOLLOW WARNING COULD RESULT IN SERIOUS PERSONAL INJURY OR DEATH.

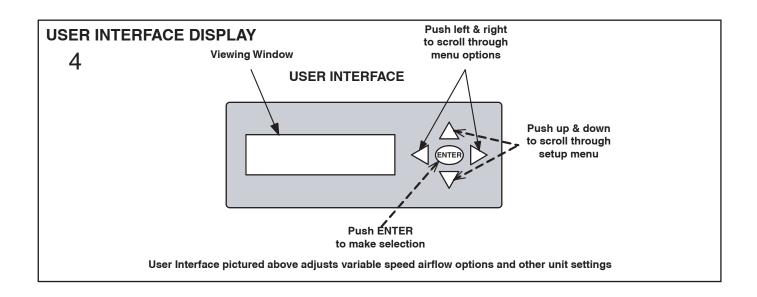

WARNING

ELECTRICAL SHOCK HAZARD

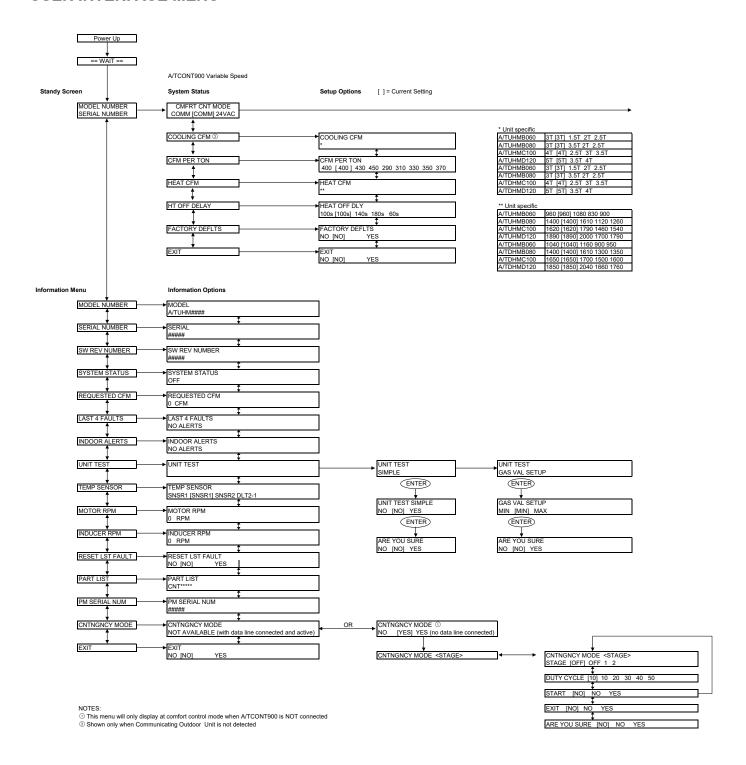

DO NOT TOUCH ANY COMPONENTS OTHER THAN THE DISPLAY ASSEMBLY AND THE DOOR SWITCH DURING THIS PROCEDURE.

FAILURE TO FOLLOW WARNING COULD RESULT IN SERIOUS PERSONAL INJURY OR DEATH.

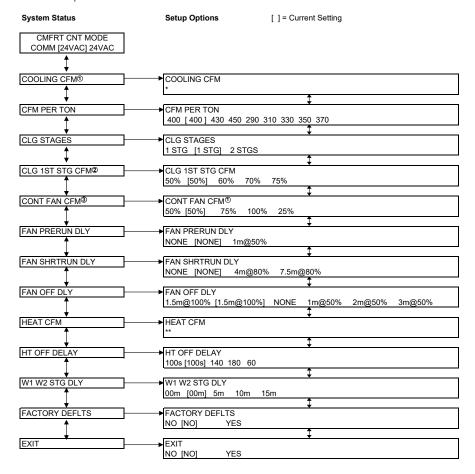

- 1. Remove Blower Door panel by turning the two door latches ¼ turn.
- Lower door panel and remove from service access area.
- Using one hand, depress the door switch (there
 must be power to the control system for the Display Assembly to function) and keep the door
 switch depressed during programming.
- 4. Using the other hand move through the Display Assembly menu using the arrow buttons.
- 5. The User Interface menu on pages 7 and 8 is a guide to the menu options.
- 6. When programming is complete release door switch and replace the Blower Door.

USER INTERFACE MENU

24V Variable Speed

- ① Shown only when Communicating Outdoor Unit is not detected.
- This menu will only display when 2 STGS is chosen in previous menu.
 Do not adjust CONT FAN CFM above 50%.

SEQUENCE OF OPERATION

SEQUENCE OF OPERATION – COMMUNICATING MODE

 This furnace is fully modulating between 40% and 100% of capacity in 1% increments. The furnace always lights at approximately 65% and will modulate up or down; depending on the communicating comfort control demand. Requested capacity can be seen in the "STATUS" section of the User Interface menu.

Note:

Pressure Switch 1 closes at approximately 40% of capacity.

Pressure Switch 2 closes at approximately 65% of capacity.

Pressure Switch 3 closes at approximately 95% of capacity.

- 2. The communicating comfort control signals the furnace IFC for heat.
- 3. The IFC then checks all safeties, thermostats, and pressure switches PS1, PS2, and PS3.
- 4. The IFC signals the variable speed inducer drive to start the vent motor at the speed needed to close pressure switches PS1 and PS2.
- 5. PS1 and PS2 close.
- The IFC receives a 24 VAC signal from PS1 and PS2 when they close. This verifies the vent motor is moving the correct amount of combustion air through the furnace and the vent system.
- 7. IFC starts the hot surface ignitor learning routine warm-up time cycle.
- 8. IFC turns on the gas valve. Trial time for ignition is 5 seconds.

Note:

The furnace lights at approximately 65% of capacity.

- 9. The IFC verifies ignition by the flame current sensing method. If a flame is not detected, the IFC will cycle the furnace three times to try and verify a flame. If no flame is detected, the IFC will lockout for one hour. The IFC will send an alert code to the communicating comfort control and User Interface. The Red alert LED two times repeatedly.
- 10. If a flame is detected, the IFC will start the heat exchanger warm-up time delay for the indoor blower.
- 11. "IGNITION" will now be displayed in the "STATUS" section of the User Interface menu.
- After 45 seconds, the IFC signals the indoor blower motor to run at the programmed ignition sequence speed.
- 13. Depending on the communicating comfort control demand, the IFC will then signal the variable speed inducer motor drive board and the indoor blower motor to ramp up or down.
- 14. With a heat demand less than 65% from the communicating comfort control, the IFC signals the variable speed inducer motor drive board to ramp down to that corresponding demand speed. The reduction

- of the vent motor speed in steps allows the gas flow through the gas valve to also be reduced in steps, decreasing the chance of burner flame out. The minimum capacity change is 1%.
- 15. The minimum capacity of all furnaces is 40%, with the exception of the *UHMD120. The minimum capacity for this furnace is 45%.
- The communicating comfort control will continue to call for the requested capacity demand until the indoor temperature is back at the set point OR,
- 17. If the communicating comfort control does not detect that the indoor temperature is moving back towards its set point or the indoor temperature is still moving away from the set point, it will signal the IFC to go to a higher capacity of heat.
- 18. The IFC then signals the variable speed inducer drive to ramp up the vent motor in steps. As the vent motor speed increases the amount of gas coming through the gas valve will increase. The IFC will also increase the indoor blower motor speed.
- 19. The communicating comfort control will continue to monitor the indoor temperature and send signals to the IFC to modulate the heating capacity or turn off to maintain the homeowner's set point.
- 20. Once the communicating comfort control senses that the heating requirements have been satisfied, the gas valve will be de-energized and gas flow will cease. The variable speed vent motor will deenergize approximately after a 5 second post purge. All pressure switches will open and the indoor blower motor will then run the heat off delay that is selected in the User Interface menu.

Indoor Blower motor operation thermostat fan switch "ON" (Communicating Mode)

The communicating comfort control signals a continuous fan call. The factory setting is 50% of the cooling cfm selected but can be adjusted from 25% - 100% through the Installer Setup menu on the communicating comfort control. If the outdoor unit is a 2 stage system, the factory setting is 50% of the 2nd stage cooling cfm. If the outdoor unit is a 24 volt single stage cooling system, the factory setting is 50% of the cooling cfm.

NOTE: If the actual relative humidity (RH) is at or below the set-point, the fan will run until the continuous fan call is removed or the actual RH exceeds the set-point. If the actual RH is above the set-point, the fan will not turn on. See the communicating comfort control Installer's Guide for additional information.

SEQUENCE OF OPERATION - 24VAC Mode

 This furnace modulates between 40% and 100% of capacity, in 3% increments, every 1 minute. The furnace always lights at approximately 65% and will modulate up or down; depending on the 24VAC thermostat signal. Requested capacity can be seen in the "STATUS" section of the User Interface menu.

Note:

Pressure Switch 1 closes at approximately 40% of capacity.

Pressure Switch 2 closes at approximately 65% of capacity.

Pressure Switch 3 closes at approximately 95% of capacity.

Thermostat call for W1 (2 stage heating thermostat)

2. R and W1 contacts close signaling the control board (IFC) to run its self- check routine. After the control has verified that all safeties are closed and PS1, PS2, and PS3 pressure switch contacts are open, the IFC signals the variable speed inducer drive to start the vent motor at the speed needed to close pressure switches PS1 and PS2.

Note:

The furnace lights at approximately 65% of capacity.

- 3. PS1 and PS2 close.
- 4. The IFC receives a 24 VAC signal from PS1 and PS2 when they close. This verifies the vent motor is moving the correct amount of combustion air through the furnace and the vent system.
- 5. IFC starts the hot surface ignitor learning routine warm-up time cycle.
- 6. IFC turns on the gas valve. Trial time for ignition is 5 seconds.
- 7. The IFC verifies ignition by the flame current sensing method. If a flame is not detected, the IFC will cycle the furnace three times to try and verify a flame. If no flame is detected, the IFC will lockout for one hour. The IFC will send an alert code to the communicating comfort control and User Interface as well as flash its Red alert LED two times repeatedly.
- 8. If a flame is detected, the IFC will start the heat exchanger warm-up time delay for the indoor blower.
- 9. "IGNITION" will now be displayed in the "STATUS" section of the User Interface menu.
- After 45 seconds, the IFC signals the indoor blower motor to run at the programmed ignition sequence speed.
- 11. The IFC then signals the variable speed inducer motor drive board to ramp down to the corresponding speed to keep PS1 closed. The reduction of the vent motor speed in steps allows the gas flow through the gas valve to also be reduced in steps, decreasing the chance of burner flame out. The W1 heating capacity is 40%. The IFC will also decrease the indoor blower motor speed.

Thermostat call for W2 after W1

12. R and W2 thermostat contacts close signaling a call for W2 heat. The IFC then signals the variable speed inducer drive to ramp up the vent motor allowing flow through the gas valve to also be increased in 3% steps.

13. If the call for W2 remains, this 3% increase will be repeated every 1 minute until the capacity requested is 100%. The IFC will also increase the indoor blower motor speed in appropriate steps.

W2 satisfied, W1 still called for

14. R and W2 thermostat contacts open signaling that W2 heating requirements have been satisfied. The IFC will signal the variable speed vent motor to slow down to its learned W1 speed. The gas valve will reduce the gas flow to 40% capacity and the indoor blower motor speed will be reduced.

W1 satisfied

15. R and W1 thermostat contacts open signaling that W1 heating requirements have been satisfied. The gas valve will be de-energized and gas flow will cease. The variable speed vent motor will de-energize approximately after a 5 second post purge. The indoor blower motor will be de-energized after the fan off delay period has ended. (The indoor blower heat fan off delay is field selectable and can be adjusted using the User Interface menu. It is factory set at 100 seconds but can be set to 60, 140, or 180 seconds)

Thermostat call for heat (1 stage heating thermostat)

16. W1 and W2 must be jumpered at the IFC. R and W1 contacts close signaling the control board (IFC) to run its self- check routine. After the control has verified that all safeties are closed and PS1, PS2, and PS3 pressure switch contacts are open, the IFC signals the variable speed inducer drive to start the vent motor at the speed needed to close pressure switches PS1 and PS2.

Note:

The furnace lights at approximately 65% of capacity.

- 17. PS1 and PS2 close.
- 18. The IFC receives a 24 VAC signal from PS1 and PS2 when they close. This verifies the vent motor is moving the correct amount of combustion air through the furnace and the vent system.
- 19. IFC starts the hot surface ignitor learning routine warm-up time cycle.
- 20. IFC turns on the gas valve. Trial time for ignition is 5 seconds.
- 21. The IFC verifies ignition by the flame current sensing method. If a flame is not detected, the IFC will cycle the furnace three times to try and verify a flame. If no flame is detected, the IFC will lockout for one hour. The IFC will send an alert code to the communicating comfort control and User Interface as well as flash its Red alert LED two times repeatedly.
- 22. If a flame is detected, the IFC will start the heat exchanger warm-up time delay for the indoor blower.
- 23. "IGNITION" will now be displayed in the "STATUS" section of the User Interface menu.

- 24. After 45 seconds, the IFC signals the indoor blower motor to run at the programmed ignition sequence speed.
- 25. Every 1 minute, the IFC will signal the vent motor to ramp up. The increase of the vent motor speed allows the gas flow through the gas valve to also be increased in 3% steps. This 3% increase will be repeated every 1 minute until the capacity requested is 100%. Pressure switch 3 closes at approximately 95% of capacity.
- 26. The IFC will also increase the indoor blower motor speed in appropriate steps. (The inter-stage delay is field selectable and can be adjusted through the User interface menu.
 - It is factory set at 0 minutes but can be adjusted to 5, 10, or 15 minutes.) This option can help optimize the furnace to try to satisfy the heating requirement during low heating load conditions.

Indoor Blower motor operation thermostat fan switch "CONTINUOUS" (24V Mode)

R and G comfort control contacts close signaling a continuous fan call. The continuous fan cfm is field selectable and can be adjusted through the User Interface menu. The factory setting is 50% of the cooling cfm selected but can be set at 25%. If the system has a 2 stage outdoor unit, the setting is 50% of the 2nd stage cooling cfm.

UNIT TEST MODE A) SIMPLE

Note:

Stage 1 = 40% (low) heat, Stage 2 = 100% (high) heat

A qualified technician can cycle the Variable Speed
Indoor Blower and the Modulating Gas Furnace
through its operation at the User Interface.

- The unit test cycle is entered at the user interface.
- The test cycle can only be entered when the comfort control has no demand and the furnace IFC is not reporting a fault. Turn the comfort control to the Off position and turn the fan control to Auto. This will ensure the unit test cycle will not be interrupted.
- Scroll down using the → button at the user interface until the display reads:
- UNIT TEST. Press the Enter button.
- UNIT TEST and ◆ NO (NO) → will now be displayed. Use the ◆ or ▶ arrow button to

change the NO to a YES and then press ENTER.

 ARE YOU SURE and NO (NO) will now be displayed. Use the ◆ or ▶ arrow button to

change the **NO** to a **YES** and then press **ENTER**.

- UNIT TEST and Y1 ON FAN ON will now be displayed. The variable speed indoor blower will then be turned on by the IFC for 10 seconds and then off.
- Furnace will then transition to the ignition sequence.
 STAGE OFF will now be displayed. After a 45 second heat fan on delay, Stage 1 will be displayed and 40% (low) heat inducer speed will be energized for 10 seconds.
- **Stage 2** will be displayed and 100% (high) heat inducer speed will be energized for 10 seconds.
- The control transitions to off.
- The **Model** and **Serial Number** will be displayed.
- The variable speed indoor blower will now operate for the heat exchanger cool down cycle and then shut off at the end of the cycle.
- The comfort control can now be returned to the homeowner's desired settings.

B) GAS VALVE SETUP (MANIFOLD PRESSURE ADJUSTMENT)

NOTE: To obtain an accurate manifold pressure measurement ,the manifold pressure must be referenced to the burner box, since the burner box pressure tap equalizes the gas valve pressure regulator. To do so, install a tee and section of tube (field supplied) in the tubing between the tee coming from the burner box tube and the gas valve manifold pressure measurement fitting. This tube and tee is in addition to the tube attached to the gas valve pressure tap on the outlet side of the gas valve. See Figure 7.

NOTE: In order to properly set the manifold gas pressure, the incoming line gas pressure should be tested with the unit off and again with the unit operating at the high heat setting to ensure adequate fuel supply to the furnace. The incoming gas pressure should be 5" W.C. minimum and 13.8" W.C. maximum for natural gas.

1) Before Setting Manifold Gas Pressure

Setting the manifold gas pressures is critical for the correct operation of this furnace.

Before entering the Gas Valve Setup mode:

Turn comfort control system switch to the OFF position and fan switch to the AUTO position.

b. Prime the furnace condensate trap.

Any call for heat or fan by the comfort control will abort or cancel the Gas Valve Setup mode. The unit will stay in Gas Valve Setup mode for a maximum of 20 minutes.

Connect dual port manometer & field tubing per Figure 6.

Note: MIN = 40% (low) heat, MAX = 100% (high) heat

Setting Manifold Gas Pressure

2) Setting "MIN" manifold gas pressure

To enter the Gas Valve Setup mode:

- a. Scroll down on the user interface to Unit Test.
- b. Scroll to the right and select "Gas Val Setup".
- c. Push the Enter button.
- d. Select "MIN" and push the Enter button.
- e. When asked "Are You Sure", select Yes, and push the Enter button.
- f. The furnace will now begin the ignition sequence.
- g. If pressure switch 1 & 2 learning routines have not been performed; after successful ignition, the inducer will go through this operation. (see Inducer Learning Routine section).

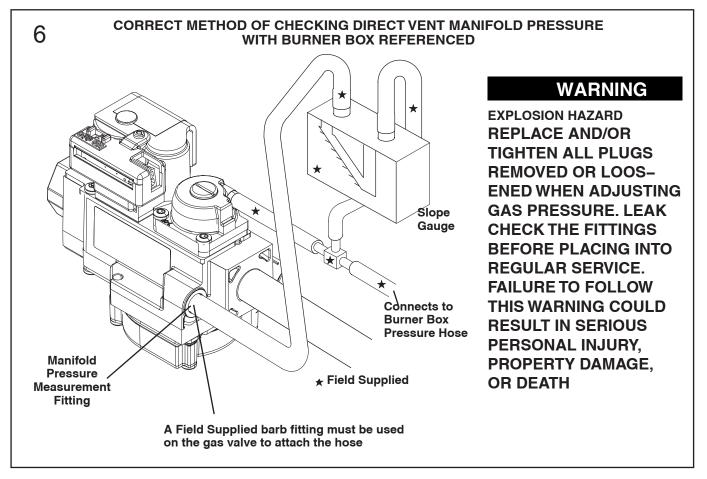

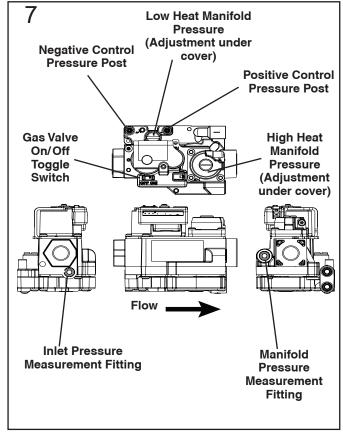

TABLE 1

Furnace Input	FINAL NG MANIFOLD PRESSURE SETTINGS (inches w.c.)				
rate (KBTU/hr)	40%	65%	100%		
60	0.7 + 0.2 / - 0.0	Not Adjustable	3.5 ± 0.2		
80	0.7 + 0.2 / - 0.0	Not Adjustable	3.5 ± 0.2		
100	0.7 + 0.2 / - 0.0	Not Adjustable	3.5 ± 0.2		
Downflow 120	0.7 + 0.2 / - 0.0	Not Adjustable	3.5 ± 0.2		
Upflow 120	0.9 + 0.2 / - 0.0	Not Adjustable	3.5 ± 0.2		
For upflow 120KBTU/hr model, 1st stage is 45%					

For upflow 120KBTU/hr model, 1st stage is 45%
Manifold pressures apply for Natural Gas applications ONLY

Furnace Input	FINAL LP MANIFOLD PRESSURE SETTINGS (inches w.c.)			
rate (KBTU/hr)	40%	65%	100%	
60	2.1 ± 0.5	Not Adjustable	10.0 ± 0.5	
80	2.1 ± 0.5	Not Adjustable	10.0 ± 0.5	
100	2.1 ± 0.5	Not Adjustable	10.0 ± 0.5	
Downflow 120	2.1 ± 0.5	Not Adjustable	10.0 ± 0.5	
Upflow 120	2.9 ± 0.5	Not Adjustable	10.0 ± 0.5	

For upflow 120KBTU/hr model, 1st stage is 45% Manifold pressures apply for Propane applications ONLY

- h. Allow 5 minutes to pass before attempting to adjust the 40% manifold pressure. This will insure that the learning routine is complete and that the heat rise is stable.
- j. Read the 40% manifold pressure.
- k. If needed, remove the low heat manifold adjustment cover and adjust to obtain the correct manifold pressure. See Figure 7.

40% (LOW) HEAT ADJUSTMENT: TURN CLOCKWISE TO DECREASE MANIFOLD PRESSURE OR COUN-TERCLOCKWISE TO INCREASE MANIFOLD PRES-SURE.

- Use Manifold Pressure Settings Table 1 for the correct manifold pressure setting in Inches of Water Column.
- m. Once the 40% manifold pressure has been adjusted; push the Enter button on the user interface. This will stop the gas valve setup mode and take you back to the home screen.
- 3) Setting "MAX" manifold gas pressure

To enter the Gas Valve Setup mode:

- a. Scroll down on the user interface to Unit Test.
- b. Scroll to the right and select "Gas Val Setup".
- c. Push the Enter button.
- Scroll to the right and select MAX; then push the Enter button.
- e. Select "MAX" and push the Enter button.
- When asked "Are You Sure", select Yes, and push the Enter button.
- g. The furnace will now begin another ignition sequence.
- If pressure switch 2 & 3 learning routines have not been performed; after successful ignition, the inducer will go through this operation. (see Inducer Learning Routine section).
- Allow 5 minutes to pass before attempting to adjust the 100% manifold pressure. This will insure that the learning routine is complete and that the heat rise is stable.
- j. Read the 100% manifold pressure.
- k. If needed, remove the high heat manifold adjustment cover and adjust to obtain the correct manifold pressure. See Figure 7.

100% (HIGH) HEAT ADJUSTMENT: COUNTER-CLOCKWISE TO DECREASE MANIFOLD PRESSURE OR CLOCKWISE TO INCREASE MANIFOLD PRES-SURE.

- Use Manifold Pressure Settings Table 1 for the correct manifold pressure setting in Inches of Water Column.
- m. Replace and tighten the adjustment cover for the high heat and read the manifold pressure again. This procedure may need to be repeated until the correct manifold pressure is obtained.

NOTE: The adjustment cover over the high heat must be in place during manifold gas pressure readings. See Figure 6.

- n. If the firing rate cannot be obtained with the manifold pressures specified in Table 1, the orifices must be changed. If a change of orifices is required to correct the furnace input rating, refer to Table 17 on page 39 of the Installer's guide.
- o. Once the 100% manifold pressure has been adjusted; push the Enter button on the user interface. This will stop the gas valve setup mode and take you back to the home screen.

WARNING

EXPLOSION HAZARD

REPLACE AND/OR TIGHTEN ALL PLUGS REMOVED OR LOOSENED WHEN ADJUST-ING GAS PRESSURE. LEAK CHECK THE FITTINGS BEFORE PLACING INTO REGU-LAR SERVICE.

FAILURE TO FOLLOW THIS WARNING COULD RESULT IN SERIOUS PERSONAL INJURY, PROPERTY DAMAGE, OR DEATH.

- p. Remove all field supplied tubing and measurement devices. Reinstall and tighten all covers and outlet pressure tap screw.
- q. Leak test all gas fittings using a leak detection solution or soap suds.
- Turn comfort control to home owners desired temperature.

PERSONALITY MODULE

The Personality Module is a removable memory device, on which is stored model specific data required for proper furnace operation. The Personality Module is tethered to the unit and must remain with the furnace at all times. The Personality module must remain plugged into the furnace IFC.

STAND ALONE OPERATION

(CONTINGENCY MODE)

The Contingency Mode allows the installer to set the equipment to operate in an ON/ OFF Duty Cycle mode. This mode will be activated using the User Interface. • Contingency Mode is NOT available in 24VAC mode. The user will select the desired level of capacity required, Stage 1 (40%) or 2 (100%). The user will • select the desired ON/ OFF Duty Cycle, 10% minimum to 50% maximum, (10% increments, 10% = 2 minutes On, 18 minutes Off; 50% = 10 minutes on, 10 minutes off).

CONTINGENCY MODE

Note:

Stage 1 = 40% (low) heat, Stage 2 = 100% (high) heat Note:

If a communicating comfort control is detected to be present and the contingency mode is selected, NOT AVAILABLE will be displayed on the User Interface.

- Stand alone operation can only be entered at the user interface.
- Stand alone operation can be set up to operate the furnace in Heating Only.
- The contingency mode is used when the communicating comfort Control is not communicating with the furnace or when setting gas manifold pressures.
- Before attempting to enter contingency mode, disconnect the Data wire "D" from the Furnace IFC terminal block.
- The contingency mode will function only when the Furnace IFC is not flashing a fault code at its Fault LED.
- To enter the contingency mode of operation, turn 115 VAC power off. When the Green LED on the variable speed inducer drive goes out, turn 115 VAC power back on.
- Scroll down using the down arrow

 at the User Interface until you see CNTNGNCY Mode, then press the Enter button.
- **CNTNGNCY MODE** and **◆ STAGE →** will now be displayed. Press the **Enter** button.
- STAGE and ◆ OFF [OFF] will now be displayed. First or Second heat stage must be selected. Use the ◆ or ▶ arrows to select the stage of heat wanted and then push the Enter button and then the ▼ button.
- **DUTY CYCLE** and **10%** [**10%**] will now be displayed. A duty cycle **must** now be selected from 10 to 50%. A 10% duty cycle will run the furnace for 2 minutes and then off for 18 minutes. A 50% duty cycle will run the furnace for 10 minutes and then be off for 10 minutes. These duty cycles will be repeated 3 times per hour. Use the ◀ or ▶ arrows to select a duty cycle and then push the **Enter** button and then the ▼ button.
- Start and NO [NO] will now be displayed. With a NO/ NO question being asked, use the ◀ or ▶ arrows to select the YES and then press the ENTER button. UHM-DHM-SF-1W-EN

- Are you Sure and NO [NO] will now be displayed.
 With a NO/ NO question being asked, use the ◀ or ▶ arrows to select the YES and then press the ENTER button.
- Turn 115VAC power off. When the Green LED on the variable speed inducer drive goes out, turn 115 VAC power back on.
- When the furnace is operating in the contingency mode (stand alone operating cycle), the user interface will display the following information. The top line will say CNTNGNCY MODE. The bottom line will show the duty cycle stage number STG (1 or 2) selected, and the percent number 10-50 % selected.
- All furnace operating controls, pressure switches and communications between the IFC and the variable speed inducer drive and the variable speed indoor blower will be functional during contingency mode operation of the furnace.
- The ◆ ➤ ▼ and ENTER buttons do not function in the contingency mode of operation.
- To exit the contingency mode of operation turn off the 115 VAC power to the furnace.
- The contingency mode will stop for any of the following reasons:
 - (1) If the furnace IFC receives a signal from the communicating comfort control. This will only happen if the data wire "D" from the comfort control has been reconnected to the furnace IFC terminal board terminal "D".
 - **(2)** Power is removed from the furnace and then turned back on.
 - (3) The Furnace IFC enters a **RESET** mode of operation.
 - (4) A fault is detected by the furnace IFC. Fault LED will be flashing an Alert Code.

24V CONTINGENCY MODE

An alternative method for the contingency mode can be used by changing the mode of operation in the Use Interface to 24V mode and installing a conventional 24V comfort control.

To set this mode of operation:

Remove all wiring from the *CONT900 comfort control and install a 24V comfort control. If the comfort control requires a 24V common; connect R and B to respective terminals. Connect a third wire to "W". At the control board, connect the same three wires to the corresponding terminals. Jumper W1 to W2 at the control board. The stage delay between W1 and W2 can be set by scrolling thru the User Interface. It is factory set to zero minutes but can be adjusted to 5, 10, or 15 minutes.

IFC INDUCER LEARNING ROUTINE SEQUENCE

Note:

Stage 1 = 40% (low) heat, Stage 2 = 100% (high) heat

- The furnace IFC will go through an inducer learning routine for three pressure switches.
- The learning routine is done to determine the correct amount of ventilation air for complete combustion.
- The inducer motor speed may be different for each installation due to the different length and size of the ventilation pipe, exhaust vent pipe, number of pipe fittings used, and the type of vent cap installed.
- The inducer learning routine is repeated each time the power to the furnace is interrupted. Once power is restored and the furnace receives a call for heat, the PS-1, PS-2 inducer learning routine will be initiated. The furnace IFC will not go through a PS-3 inducer learning routine until it receives a call for 100% (high) heat.
- To ensure the furnace heating efficiency is maintained the furnace IFC will repeat the inducer motor learning routine after:

150 Cycles at 40% (low) heat

100 Cycles at 65% (medium) heat

50 Cycles at 100% (high) heat

PS-1, PS-2 Inducer Learning Routine

- The furnace IFC checks the pressure switches PS-1, PS-2 and PS-3. They all have to be open before a heating cycle can begin.
- The furnace IFC sends a digital signal to the variable speed inducer drive to run the inducer motor at the preset factory 65% (medium) heat RPM.
- The furnace IFC waits for the PS-1 and PS-2 pressure switches to close. A 24 Volt AC signal is sent to the furnace IFC when a pressure switch closes.
- If PS-1 and PS-2 do not close at the preset factory 65% (medium) heat RPM, the furnace IFC will continue to signal the variable speed inducer drive to increase the inducer speed in steps until PS-1 and PS-2 close or until the maximum RPM for 65% (medium) heat is reached.
- When PS-1 and PS-2 switches close, the furnace IFC will then start the ignition cycle.
- The IFC now starts the igniter warm up cycle.
- Near the end of the warm up cycle the furnace IFC will turn on the gas valve.

NOTE: The furnace lights at approximately 65% of capacity.

 When the burner flame is detected by the furnace IFC, a forty-five second time delay for indoor blower

- operation begins. The forty-five second time delay allows the heat exchanger and the recuperative cell to warm up.
- The furnace IFC will now start its 65% (medium) heat inducer learning routine.
- The furnace IFC will signal the variable speed inducer drive beginning to reduce the inducer motor speed in steps until the furnace IFC detects that PS-2 is open.
- When PS-2 opens, the furnace IFC will NOTE the inducer motor RPM.
- The furnace IFC then adds an additional number of RPM to the 65% (medium) heat inducer motor NOTED RPM until PS-2 closes.
- The additional number of RPM plus this NOTED RPM is the learned 65% (medium) heat inducer operating RPM.
- The furnace IFC now stores this learned operating inducer RPM for 65% (medium) heat in its memory.
- The furnace IFC will use this stored learned operating inducer RPM for 65% (medium) heat calls it receives in the future.
- If the furnace IFC is still receiving a call for low heat operation it will now start the learning routine for 40% (low) heat.
- The furnace IFC will then continue to reduce the inducer motor RPM in steps until the furnace IFC detects that PS-1 is open.
- When PS-1 opens, the furnace IFC will NOTE the inducer motor RPM.
- The furnace IFC then adds an additional number of RPM to the 40% (low) heat inducer motor NOTED RPM until PS-1 closes.
- The additional number of RPM plus this NOTED RPM is the learned 40% (low) heat inducer operating RPM.
- The furnace IFC now stores this learned inducer operating RPM for 40% (low) heat in its memory.
- The furnace IFC will use this stored learned inducer operating RPM for 40% (low) heat calls it receives in the future.
- Whenever the furnace is powered up or after a RE-SET, the furnace IFC will not go through a learning routine for 100% (high) heat until it receives a call for 100% (high) heat.

PS-3 Inducer Learning Routine

Note:

Stage 1 = 40% (low) heat, Stage 2 = 100% (high) heat

- When the furnace IFC receives a digital signal for 100% (high) heat from the comfort control it will begin the PS-3 inducer learning routine.
- The furnace will start the heating cycle in 65% (medium) heat, if not already on, and then begins the PS-3 inducer learning routine.
- The furnace IFC will send a digital signal to the variable speed inducer drive to run the inducer motor at the preset factory 100% (high) heat RPM.
- The furnace IFC waits for PS-3 pressure switch to close. A 24 Volt AC signal is sent to the furnace IFC when the pressure switch closes.
- If PS-3 does not close at the factory preset 100% (high) heat RPM, the furnace IFC will continue to signal the variable speed inducer drive to increase the inducer speed in steps until PS-3 closes or until the maximum RPM for 100% (high) heat is reached.
- The furnace IFC enters a time delay so that the heat exchanger and the recuperative cell warm up to their high heat operating temperature. At the end of this time delay, the inducer discharge air temperature will be at its high heat operating temperature and the density of the products of combustion will be stabilized.
- The furnace will now signal the variable speed inducer drive to reduce the inducer speed in steps until PS-3 opens.
- When PS-3 opens, the furnace IFC will NOTE the inducer motor RPM.
- The furnace IFC then adds an additional number of RPM to the 100% (high) heat inducer motor NOTED RPM until PS-3 closes.
- The furnace IFC now stores this learned inducer operating RPM for 100% (high) heat in its memory.
- The furnace IFC will use this stored learned inducer operating RPM for 100% (high) heat calls it receives in the future.
- If PS-3 is not closed when the inducer reaches its maximum RPM, the furnace IFC will signal the variable speed inducer drive to reduce the inducer Motor speed in steps to its low heat LEARNED SPEED.
- The furnace IFC flashes its Red Fault LED three times repeatedly. The furnace IFC will keep operating at low heat for 10 minutes and then retry the PS-3 learning routine.

INDOOR BLOWER TIMING

Heating: The Integrated Furnace Control module

controls the Indoor Blower. The Blower start is fixed at 45 seconds after ignition. The FAN-OFF period is field selectable via the User Interface menu at 60, 100, 140, or 180 seconds. The factory setting is

100 seconds.

Cooling: Continuous Fan mode is 50% of the cool-

ing CFM. This is a selectable range on

the Comfort Control menu.

When in communicating mode, see Use Interface Menu in furnace Installer's Guide.

PERIODIC SERVICING REQUIREMENTS

WARNING

Disconnect power to the unit before removing the Blower door. Allow a minimum of 10 seconds for IFC power supply to discharge to 0 volts.

Failure to follow this warning could result in property damage, personal injury or death.

WARNING

CARBON MONOXIDE POISONING HAZARD

Failure to follow the service and/ or periodic maintenance instructions for the Furnace and venting system, could result in carbon monoxide poisoning or death.

- 1. GENERAL INSPECTION Examine the furnace installation annually for the following items:
 - a. All flue product carrying areas external to the Furnace (i.e. chimney, vent connector) are clear and free of obstruction. A vent screen in the end of the Vent (flue) Pipe must be inspected for blockage annually.
 - The vent connector is in place, slopes upward and is physically sound without holes or excessive corrosion.
 - c. The return air duct connection(s) is physically sound, is sealed to the Furnace and terminates outside the space containing the Furnace.
 - d. The physical support of the Furnace should be sound without sagging, cracks, gaps, etc., around the base so as to provide a seal between the support and the base.
 - e. There are no obvious signs of deterioration of the Eurnace.
- 2. FILTERS Filters should be cleaned or replaced (with high velocity filters only), monthly and more frequently during high use times of the year such as midsummer or midwinter.

- 3. BLOWERS The Blower size and speed determine the air volume delivered by the Furnace. The Blower motor bearings are factory lubricated and under normal operating conditions do not require servicing. Annual cleaning of the Blower wheel and housing is recommended for maximum air output, and this must be performed only by a qualified servicer or service agency.
- IGNITER This unit has a special hot surface direct ignition device that automatically lights the burners. Please note that it is very fragile and should be handled with care.

A CAUTION

Do NOT touch igniter. It is extremely hot.

5. BURNER – Gas burners do not normally require scheduled servicing, however, accumulation of foreign material may cause a yellowing flame or delayed ignition. Either condition indicates that a service call is required. For best operation, burners must be cleaned annually using brushes and vacuum cleaner.

Turn off gas and electric power supply. To clean burners, remove Burner Box cover (6 to 8 screws) and top burner bracket. Lift burners from orifices.

NOTE:

Be careful NOT to break igniter when removing burners.

Clean burners with brush and/ or vacuum cleaner. Reassemble parts by reversal of the above procedure. The Burner Box must be resealed when replacing box cover.

NOTE:

Natural gas units should not have any yellow tipped flames. This condition indicates that a service call is required. For best operation, burners must be cleaned annually using brushes and vacuum cleaner.

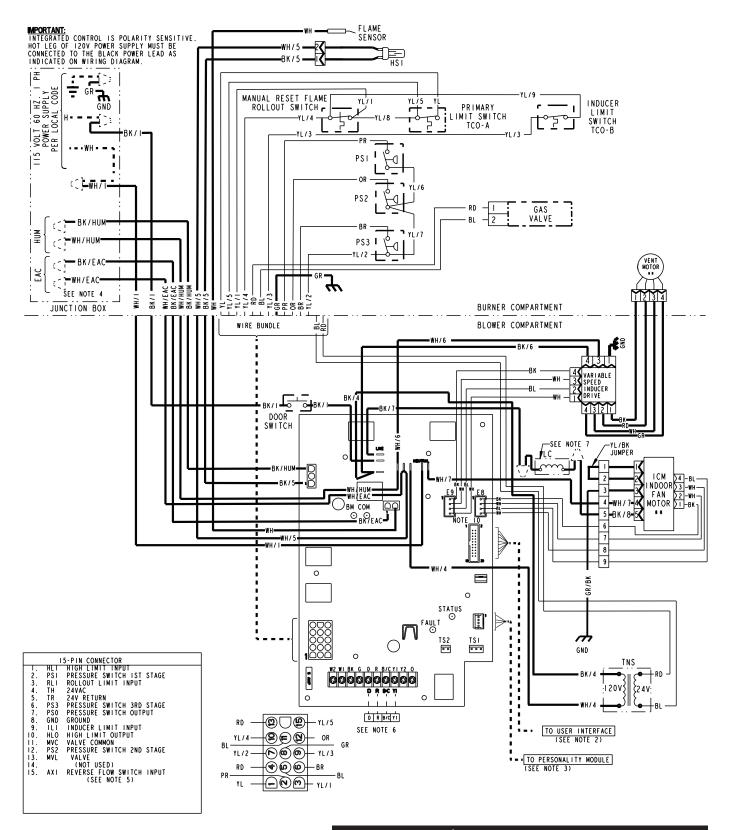

NOTE

On LP (propane) units, due to variations in BTU content and altitude, servicing may be required at shorter intervals.

- 6. HEAT EXCHANGER/ FLUE PIPE These items must be inspected for signs of corrosion, and/ or deterioration at the beginning of each heating season by a qualified service technician and cleaned annually for best operation. To clean flue gas passages, follow recommendations below:
 - a. Turn off gas and electric power supply.
 - Inspect flue pipe exterior for cracks, leaks, holes or leaky joints. Some discoloration of PVC pipe is normal.

- c. Remove burner compartment door from Furnace.
- d. Inspect around insulation covering flue collector box. Inspect induced draft Blower connections from recuperative cell and to the flue pipe connection.
- e. Remove burners. (See 5. Burner)
- f. Use a mirror and flashlight to inspect interior of Heat Exchanger, be careful not to damage the Igniter, Flame Sensor or other components.
- g. If any corrosion is present, the Heat Exchanger should be cleaned by a qualified service technician.
- After inspection is complete replace Burner Box cover, burners, and Furnace door.
- Restore gas supply. Check for leaks using a soap solution. Restore electrical supply. Check unit for normal operation.
- 7. COOLING COIL CONDENSATE DRAIN If a cooling coil is installed with the Furnace, condensate drains should be checked and cleaned periodically to assure that condensate can drain freely from coil to drain. If condensate cannot drain freely water damage could occur. (See Condensate Drain in Installer's Guide.)

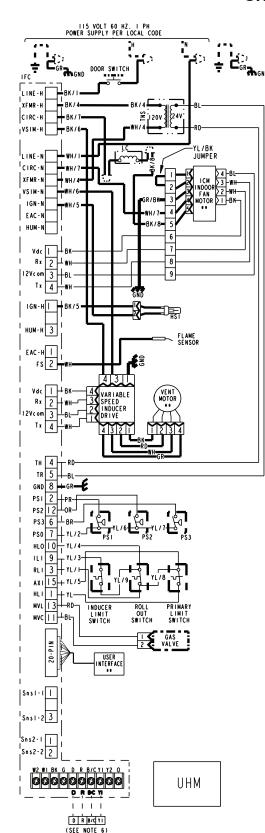

***UHM WIRING DIAGRAM**

A CAUTION

Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation. Verify proper operation after servicing.

FAILURE TO DISCONNECT POWER BEFORE SERVICING CAN CAUSE SEVERE PERSONAL INJURY OR DEATH.	TO THE EQUIPMENT.

INTEGRATED FURNACE CONTROL

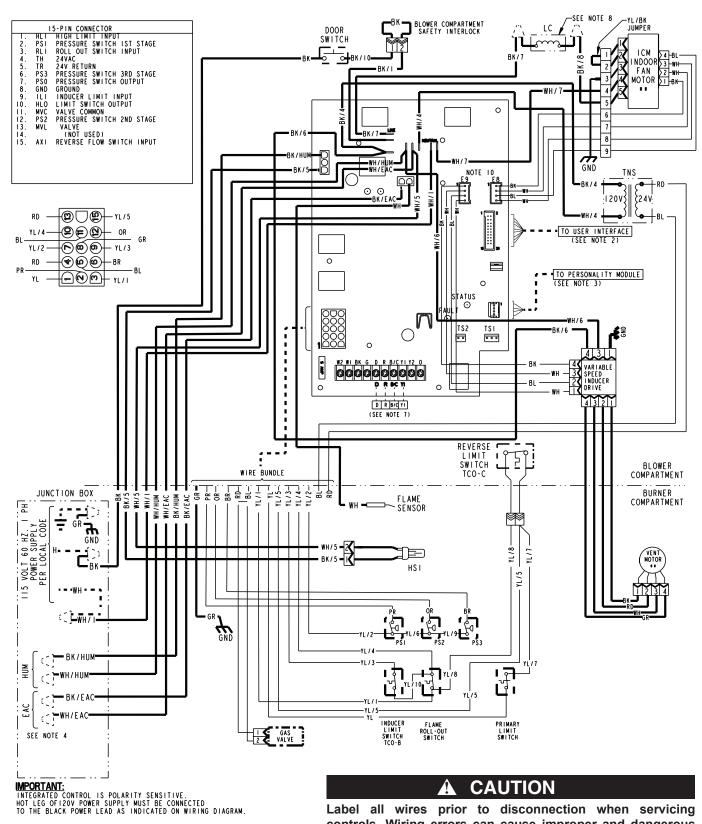

NOTES:

- IF ANY OF THE ORIGINAL WIRING AS SUPPLIED WITH THIS FURNACE MUST BE REPLACED, IT, MUST BE WITH WIRE HAVING A TEMPERATURE RATING OF AT LEAST 105°C. USER INTERFACE MUST BE INSTALLED FOR PROPER FURNACE INSTALLATION & SET-UP. CORRECT PERSONALITY MODULE IS REQUIRED FOR PROPER FURNACE OPERATION. PERSONALITY MODULE IS SPECIFIC TO EACH MODEL & SERIAL NUMBER, AND IS TO REMAIN WITHIN IT'S ORIGINAL UNIT. THESE LEADS PROVIDE 120V POWER CONNECTIONS FOR ELECTRONIC AIR CLEANER (EAC) AND HUMIDIFIER (HUM). MAX. LOAD: 1.0 AMPS EACH. ON POWER-UP, LAST FOUR FAULTS, IF ANY, WILL BE FLASHED ON RED LED. GREEN LED WILL BE SOLID ON DURING LAST FAULT RECOVERY. YI IS OUTPUT TO NON-COMMUNICATING OUTDOOR UNIT. LINE CHOKE (LC) NOT USED ON ALL MODELS. IN 24 VOLT MODE, AN OPTIONAL HUMIDISTAT CAN BE CONNECTED BETWEEN THE "R" AND "BK" TERMINALS. FACTORY INSTALLED "BK JUMPER" ON THE CIRCUIT BOARD MUST BE CUT. SEE FURNACE INSTALLERS GUIDE FOR DETAILS. USED ON UHM/UXM MODELS ONLY.

CAUTION

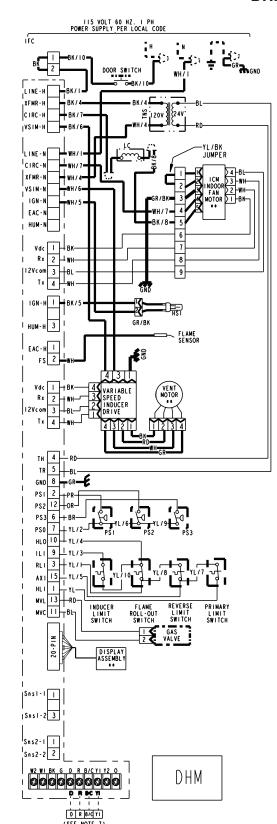

Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation. Verify proper operation after servicing.

Notes

- * First letter may be "A" or "T".
- 2. ^ Letter may be "A" through "Z"
- 3. ** Factory setting.
- 4. Continuous Fan Setting: Heating or cooling airflow is approximately 50% of selected cooling value.
- 5. LOW 350 cfm/ton is recommended for variable speed application for COMFORT & HUMID CLIMATE setting; NORMAL is 400 cfm/ton; HIGH 450 cfm/ton is for DRY CLIMATE setting.

NOTE:

CONTINUOUS fan mode during COOLING operation may not be appropriate in humid climates. If the indoor air exceeds 60% relative humidity or simply feels uncomfortably humid, it is recommended that the fan only be used in the AUTO mode.

Notes:

- Notes:

 1. * First letter may be "A" or "T".

 2. ^ Letter may be "A" through "Z".

 3. ** Factory setting.

 4. Continuous Fan Setting: Heating or cooling airflow is approximately 50% of selected cooling value.

 5. LOW 350 cfm/ton is recommended for variable speed application for COMFORT & HUMID CLIMATE setting; NORMAL is 400 cfm/ton; HIGH 450 cfm/ton is for DRY CLIMATE setting.

 6. Target airflow is field selectable for high (100%) heat. Target airflow for low and medium heat are percentages of high heat and are not field selectable.

Notes

- 1. * First letter may be "A" or "T".
- 2. ^ Letter may be "A" through "Z"
- 3. ** Factory setting.
- 4. Continuous Fan Setting: Heating or cooling airflow is approximately 50% of selected cooling value.
- 55. LOW 350 cfm/ton is recommended for variable speed application for COMFORT & HUMID CLIMATE setting; NORMAL is 400 cfm/ton; HIGH 450 cfm/ton is for DRY CLIMATE setting.

NOTE:

CONTINUOUS fan mode during COOLING operation may not be appropriate in humid climates. If the indoor air exceeds 60% relative humidity or simply feels uncomfortably humid, it is recommended that the fan only be used in the AUTO mode.

Alert Codes sorted by furnace Flash Codes

Alert codes are taken from the Alert Code Addendum and are organized by the furnace flash codes for easier reference.

Alert Notification					Alert Group	Alert Description	
Fault LED	COM LED	User Interface Display	Control Display	Code	Aleit Gloup	Flame is off when flame should be	
	Device count	RECYCLE	N/A	20	Flame lost or Ignition failure	detected. Furnace tries to relight itself.	
2 Flash		RETRY			iandio	Furnace tries to light, but no flame is detected.	
∠ FidSII		RECYCLE LO	ERR 22	22	Soft lockout due to	10 recycles within a single call for heat will cause 1hr lockout. 3 ignition attempts in a row within a	
		RETRY LO	LIMAZZ		flame lost or ignition retries	single call for heat results in 1 hr lockout.	
		PS3 OPEN				Open Pressure Switch, third stage	
	Device count	PS3 CLOSED	N/A	1	Pressure Switch Failure	Shorted Pressure Switch, third stage	
3 Flash		PS2 OPEN				Open Pressure Switch, second stage	
		PS2 CLOSED				Shorted Pressure Switch, second stage	
		PS1 OPEN				Open Pressure Switch, first stage	
		PS1 CLOSED				Shorted Pressure Switch, first stage	
		AUX LIMIT	500.00	26	High Temp Limit Fault	Open Reverse Flow - Heat exchanger temperature too high. Could be caused by low airflow or fan failure.	
4 Flash	Device count	HIGH LIMIT	ERR 26			Open High Limit - Heat exchanger temperature too high. Could be caused by low airflow or fan failure.	
		ROLLOUT OPEN	ERR 87	87	Roll Out Fault	Open flame rollout	
5 Flash	Device count	FLAME ERROR	ERR 34	34	Flame Detect Fault	Flame detected, should not be present	
		POLARITY ERR	N/A	33	Line Polarity Fault	Voltage reverse polarity	
6 Flash	Device count	GND FAULT	N/A	88	Ground Fault	Occurs when proper earth ground is not detected.	
		IGNITER ERR TRIAC ERR	ERR 10	10	Ignition Means Fault	Igniter fault Triac fault	
7 Flash		EXT GV ERR				Control senses 24V present at the gas valve when it should not be present.	
Solid ON	Device count	INT GV ERR	ERR 93	93	Gas Valve Fault	Control tried to turn on gas valve, but 24V not sensed. Control senses 24V present at the gas	
						valve when it should not be present.	
8 Flash	Device count	LO FLAME SNS	N/A	4	Low Flame Signal	Flame current is low, but still strong enough to allow operation.	
9 Flash	Device count	IND LIMIT	ERR 26	26	High Temp Limit Fault	Flue gas temperature too high. Could be caused by low airflow or fan failure	
	Device count	SYS COMM CRC	N/A	90	Communication Busy Fault Communication Fault	COMM system unrecognized response	
		IND COMM CRC				Inducer Motor unrecognized response	
		BLW COMM CRC				Blower motor unrecognized response	
10 Flash	Device count	BLW COMM ERR IND COMM ERR	EDD 04			Blower motor no COMM response ¹ Inducer motor no COMM response	
	Fast Flash	SYS COMM ERR NO SYS CLK	ERR 91			Loss of heat/cool demand Loss of clock signal	
	Device count		ERR 139	139	Communication Failure	Communication Message has been detected while configured for 24V Mode	
Solid ON	Device count	CNTRL FAULT	ERR 18	18	Control Failure	Internal control failure	
None	Device count	TWIN ERROR	N/A	19	Twinning Fault	Twinning Not Allowed with Variable Speed	
		PM DATA ERR	NI/A	114	Bad or Missing PM	Data Section is Corrupt but PM is useable	
	Device count	CAP MISMATCH	N/A ERR 114 N/A			Compressor size does not match capacity in PM	
None		ID MTR ERR				Blower HP/OEM does not match PM Data	
		PM MISSING				No PM Primary Copy of Unit Data File is	
		PM UNIT ERR				Corrupt. Primary and Secondary copies of Unit	
		PM MEM ERROR AC VOLTS LOW	ERR 114			Data File are Corrupt Voltage too low	
None	Device count	AC VOLTS HI	N/A	59	AC Line Fault	Voltage too high	
None	Device count	CHECK FUSE	N/A ERR 101	92 101	Fuse	24V Fuse Open	
None		Y1 OFF ERR Y1 ON ERR			Y1 Relay Failure	Y1 Output OFF when it should be ON Y1 Output ON when it should be OFF	
		TS 1 SHORT			<u> </u>	Temperature sensor 1 shorted.	
None	Device count	TS 1 OPEN TS 2 SHORT	N/A	119	Temperature Sensor Failure	Temperature sensor 1 open. Temperature sensor 2 shorted.	
Notes:	Comfort Co	TS 2 OPEN ontrol will switch system to	"OFF" until this fau	It condition	n clears	Temperature sensor 2 open.

ALERT CODE RECOVERY

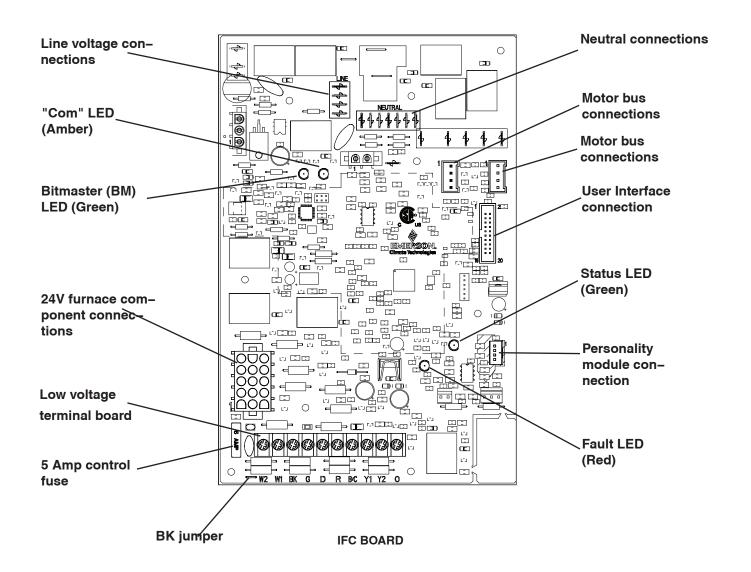

On power up, last 4 Alerts, if any, will be flashed on the Red Alert LED. The newest Alert detected will flash first and the oldest last. There will be a 2 second delay between Alert Code flashes. Solid Red LED error codes will not be displayed.

The Green BM LED will be on solid when the control is powered. The Green status LED indicator light will operate as shown in the table and the Red LED will flash (one flash) every 20 seconds.

NOTE:

Use the flash code menu for detail of the alerts. Alert codes also are displayed on the User Interface menu using a descriptive text message and on the comfort control display using an alert code number. A complete list of the alert codes is included with the comfort control.

LED	DESCRIPTION	FUNCTION
GREEN	STATUS LED	FAST FLASH - CALL FOR HEAT SLOW FLASH - NO CALL FOR HEAT
RED	ALERT LED	NO. OF FLASHES - SEE DIAGNOSTIC CODES
GREEN (BM)	BITMASTER	ON SOLID WHEN UNIT POWERED
AMBER	СОМ	FLASHES DEVICE COUNT

The following pages include troubleshooting flowcharts in reference to the modulating 95% communicating furnaces ONLY; using the FAULT LED and the User Interface as starting points.

The information contained is for reference only and does not cover all scenarios or problems that may be encountered by a qualified field technician.

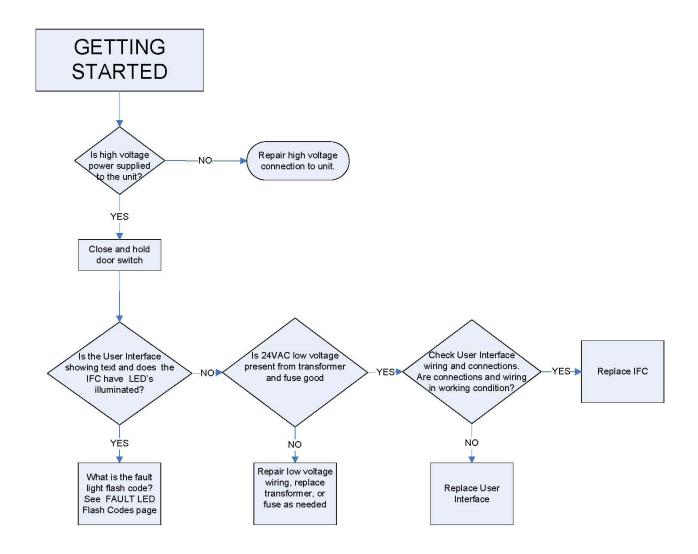

Only qualified technicians should should attempt to install, troubleshoot, or repair this appliance. Failure to follow all cautions and/or warnings could result in personal or property damage; including death.

Integrated Furnace Control (IFC) Component Layout

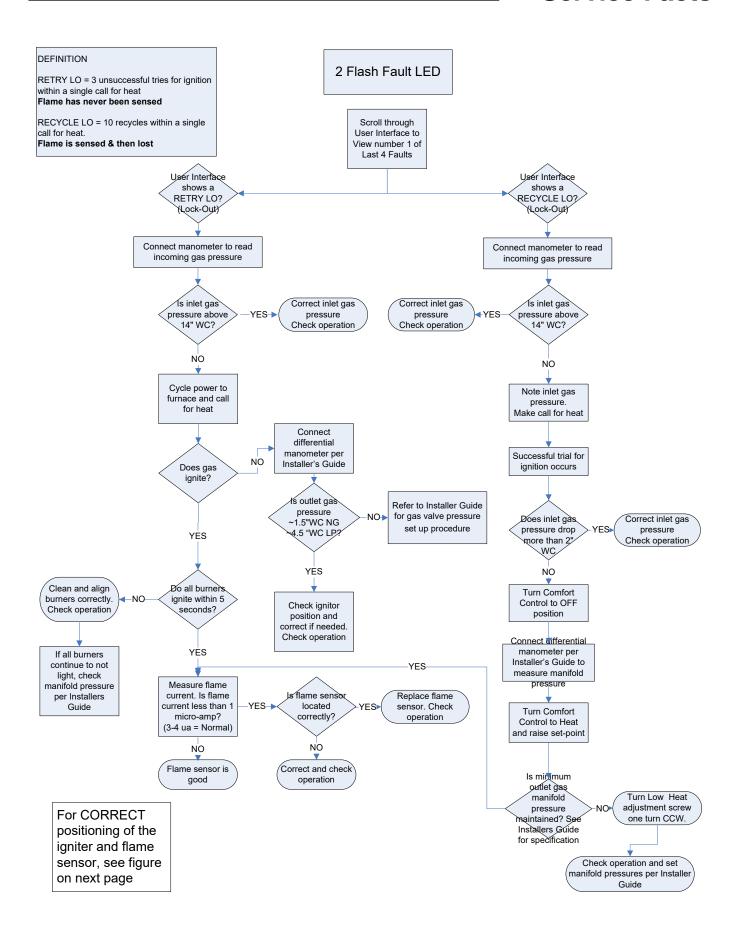

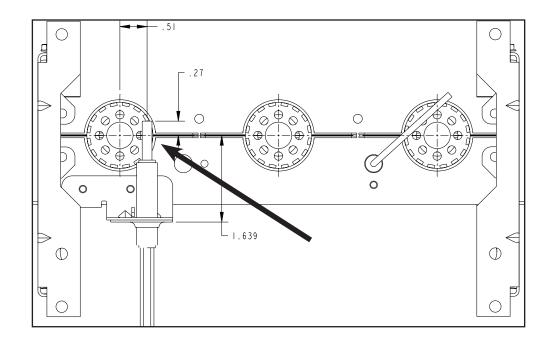

LED Flash Codes

RED LED FLASH	ERROR
2	External Lockout (3 Retries or 11 Recycles Exceeded)
3	Pressure Switch or Inducer Error
4	Open High, Auxiliary, or Roll-out Limit Switch
5	Flame Sensed When No Flame Should Be Present
6	Earth Ground Not Detected or Poor, Reversed Polarity, Igniter or Triac Error
7	External Gas Valve Circuit Error (Voltage present when it should not be)
8	Low Flame Sensor (Less than 1 dc micro-amp)
9	Open Inducer Limit
10	Communiction Error (Loss of communication between comfort control & furnace control)
SOLID RED	Internal Gas Valve Circuit Error (Damaged furnace control)
SOLID RED SOLID STATUS	Continuous Reset Caused by an Internal Error (Damaged furnace control)
RED OFF STATUS OFF	24VAC Fuse Open (Short circuit or high secondary load)

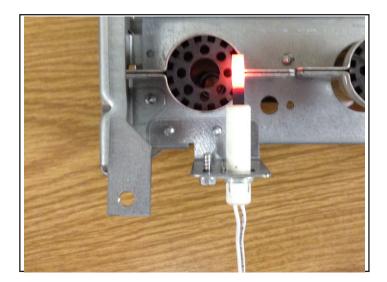

Refer to Communicating Controls Service Manual to supplement this information. Publication Number 34-4093-01

Correct positioning of ignitor and flame sensor.

NOTE the slight over lap of the ignitor and the burner.

Correct positioning of igniter.

HOT ZONE must be centered over the cross-over.

Igniter must overlap burner.

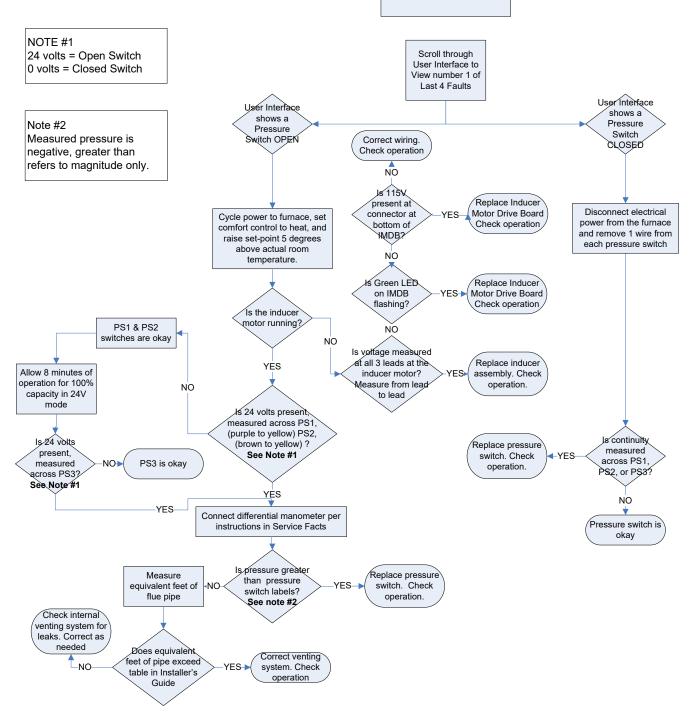

DEFINITION

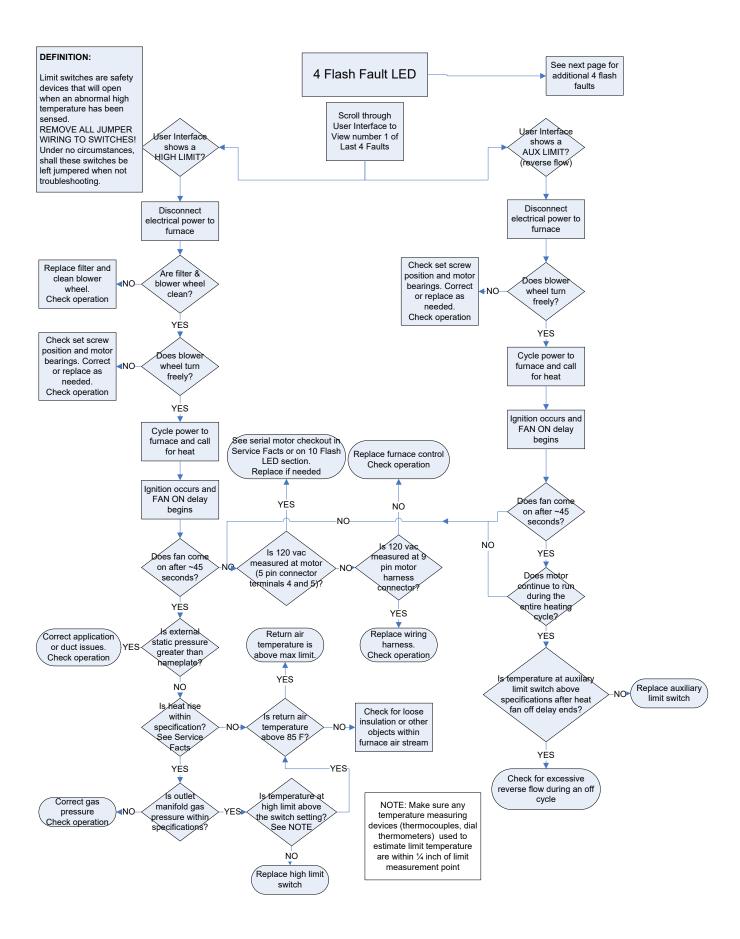

An error has occurred with either PS1, PS2, or PS3. The error will be reported, indicating that a pressure switch is either opened or closed, contrary to normal operating sequence

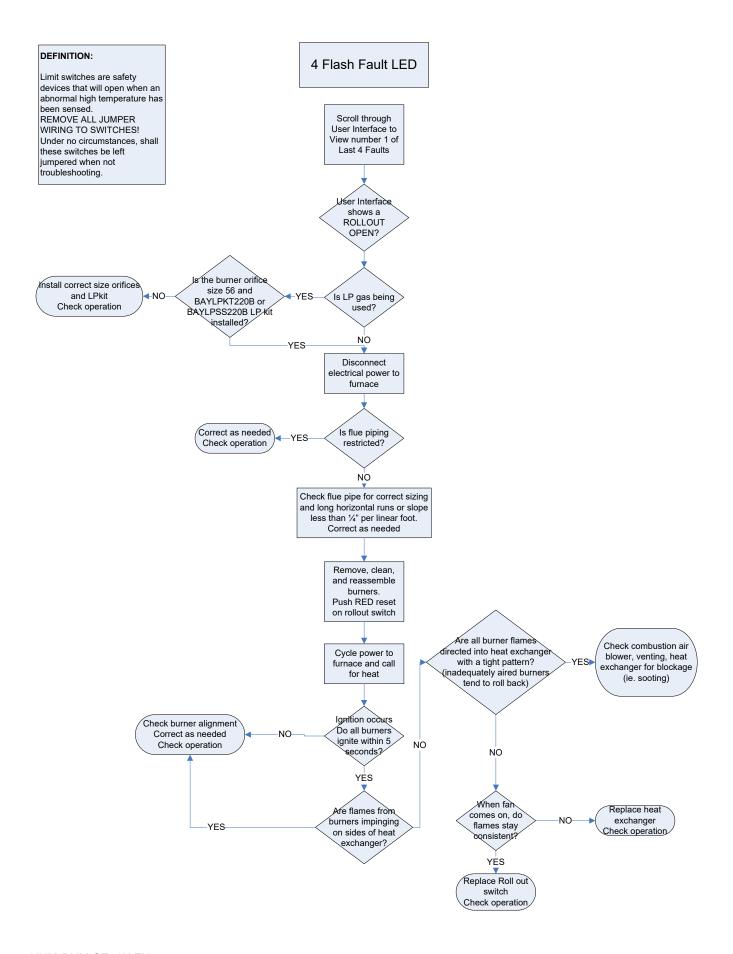

In most cases, the pressure switch is not the problem

Note: Verify all wiring and pressure switch tubing to pressure switches is correct per the diagrams found in the Service Facts Each time power is interrupted to the furnace (ie. door switch), the furnace will go through an inducer learning routine to determine the most efficient speed to close the pressure switches

3 Flash Fault LED

DEFINITION:

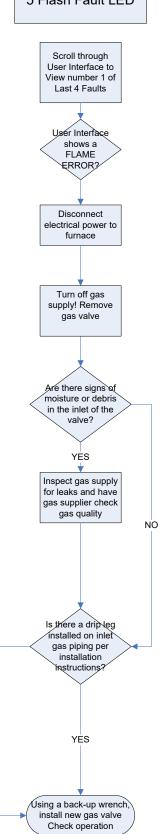

Flame is sensed when it should not be sensed.

Install drip leg per National Fuel Gas

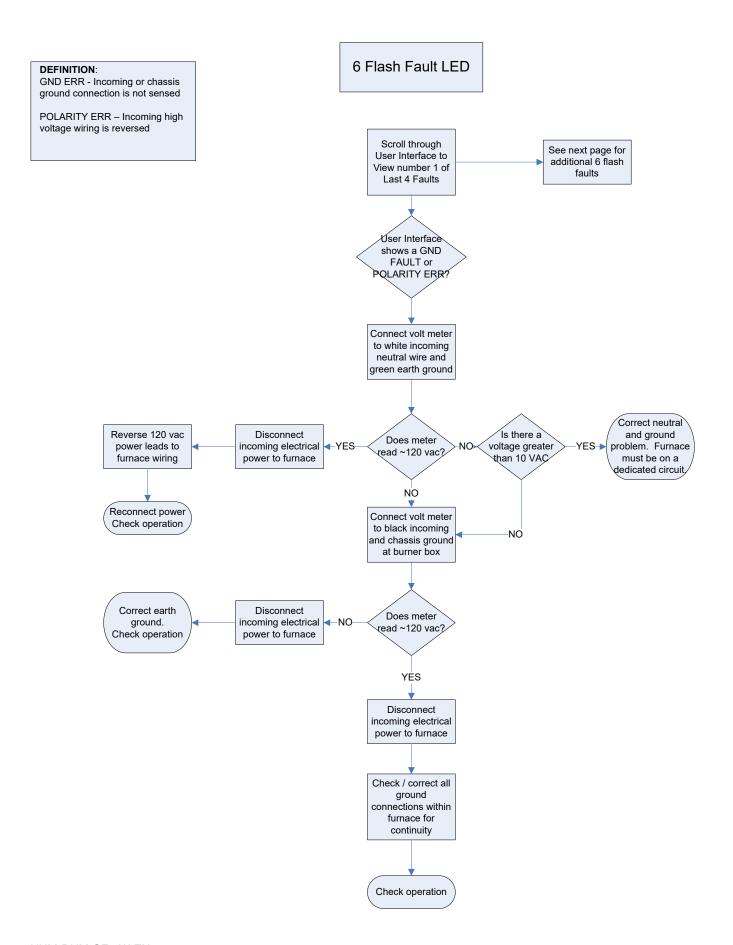

Code and

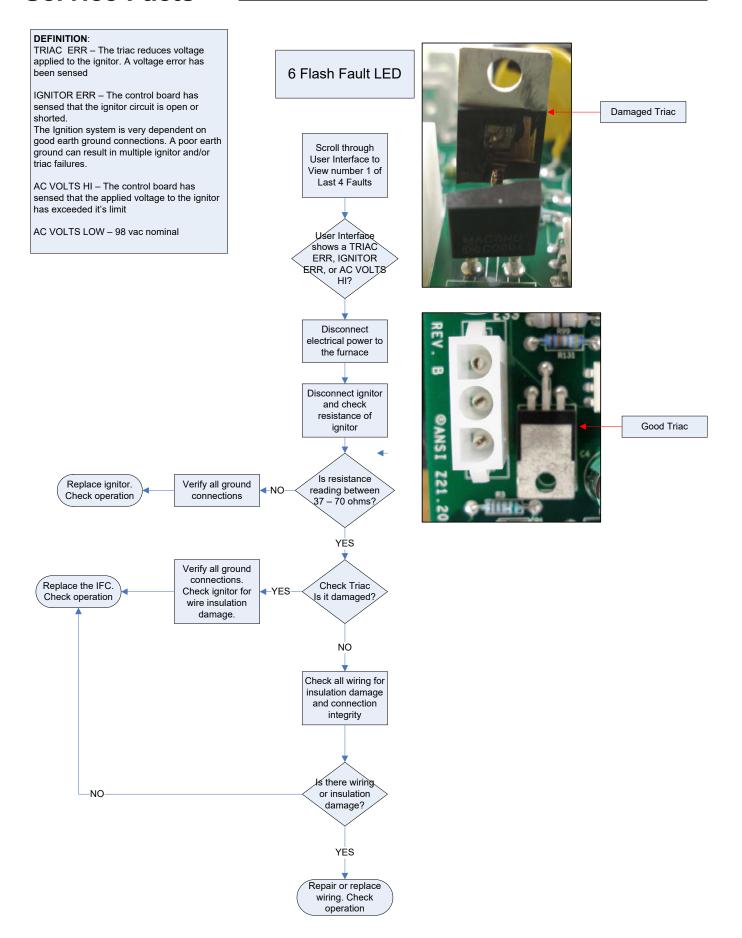

Installation Instructions NO.

5 Flash Fault LED

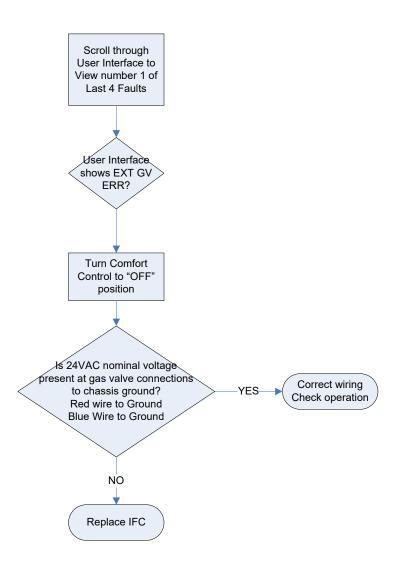

50

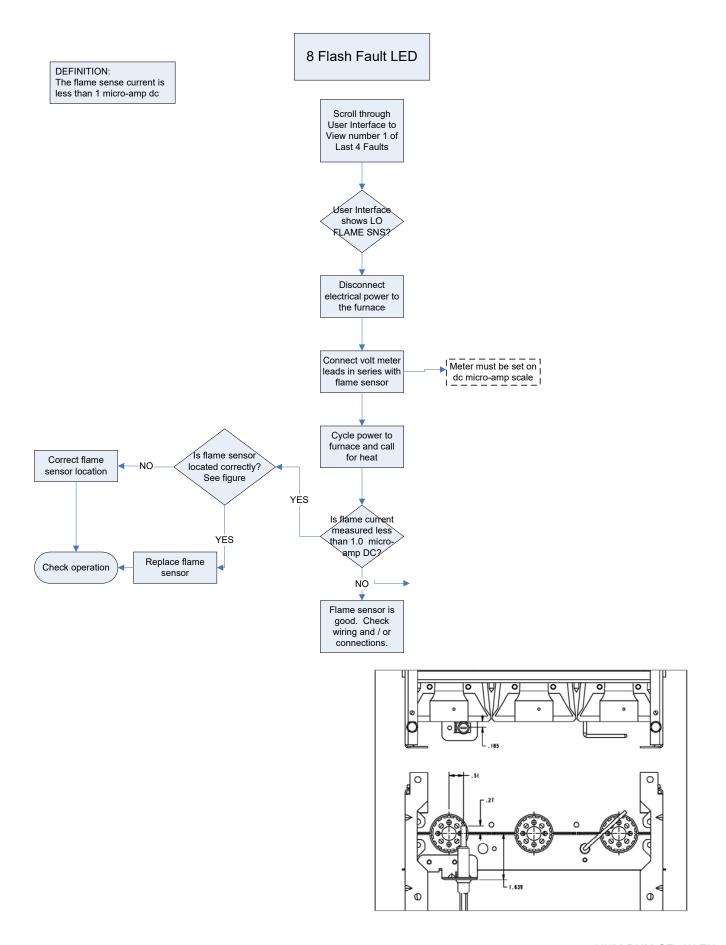

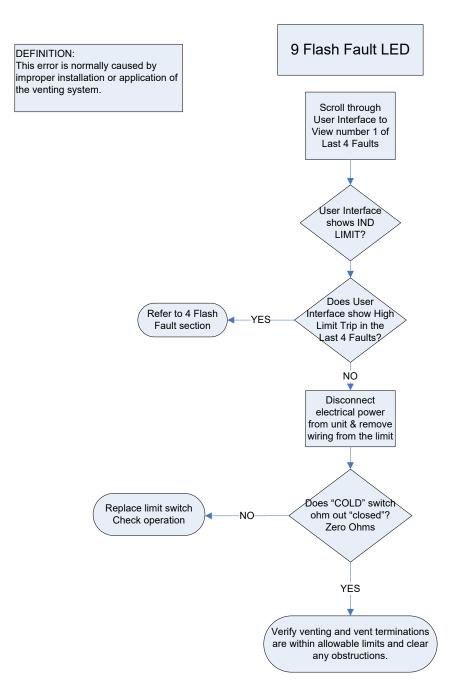

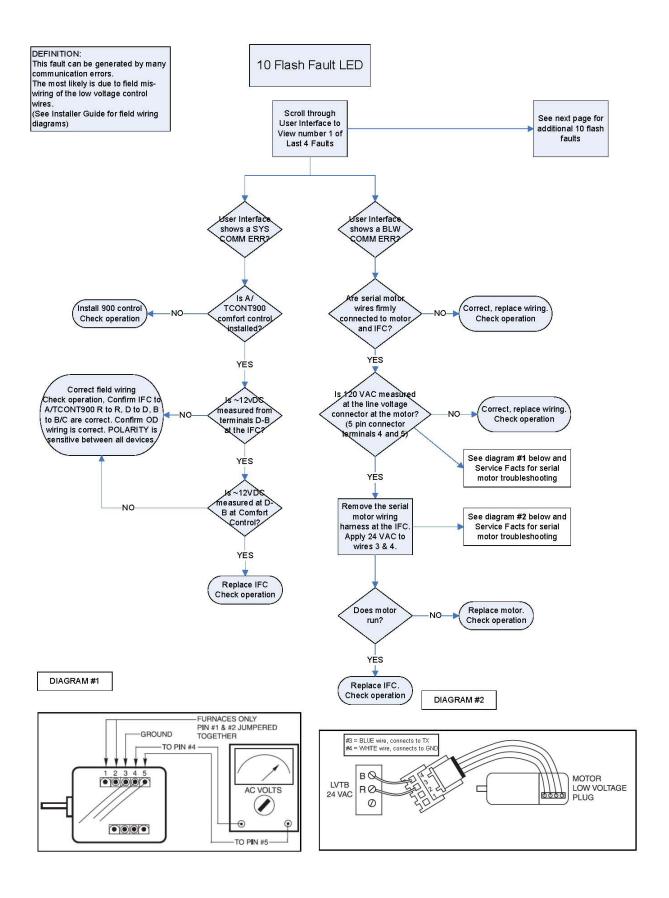

DEFINITION: External Gas Valve Circuit Error (24 volts is present when it should not be present)

7 Flash Fault LED

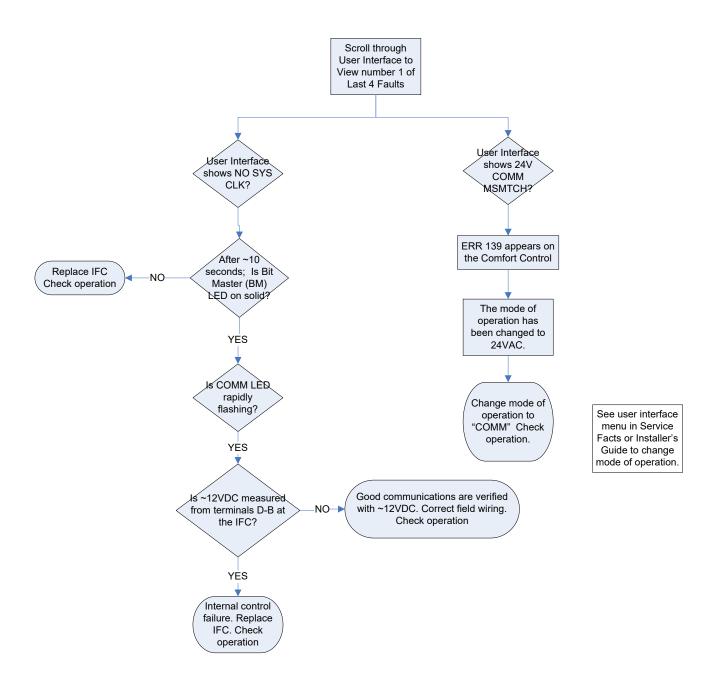

10 Flash Fault LED

About Trane and American Standard Heating and Air Conditioning

Trane and American Standard create comfortable, energy efficient indoor environments for residential applications. For more information, please visit www.trane.com or www.americanstandardair.com

This product may be covered by one or more of the following patents and their foreign equivalents: 5621888, 5901156, 6208263, 6353376, and 6448901. Other patents are pending. Made under license.

The manufacturer has a policy of continuous data improvement and it reserves the right to change design and specifications without notice. We are committed to using environmentally conscious print practices.

UHM-DHM-SF-1W-EN 22 Sep 2023 Supersedes UHM-DHM-SF-1V-EN (March 2020)
