INSTRUCTION GUIDE
PLUMBER'S PUTTY

Oatey | HERCULES | HARVEY

1 Open lid on container and remove desired amount of putty to complete your application

2 Make sure to put lid back on container to keep debris from entering the container and mixing with clean putty

3 Knead putty in hands until soft and pliable and form into a rope (roughly ½" thick)

4 Place the rope of putty around the underside of the product's flange that you are installing, making sure to blend the two ends together where they meet

5 Install your product (e.g. bath waste, shower drain, pop-up or basket strainer) as you secure your product into place, the excess putty will ooze out from under the flange

6 Remove excess putty after the product is properly secured and wipe clean

7 If putty is being used in colder applications, wait 10 minutes after the initial installation and confirm the product doesn't need a little extra turn to properly secure

8 Excess putty can be blended back into the container as long as it is still clean and free of debris
