Ideal for use in those situations when it is necessary to add longer stems or extend the length of the existing stems. Example: When renovating a shower wall, the new surface may add an inch or more to the thickness of the old wall, which could mean the existing valve stem will not protrude through the new wall. It is not necessary to replace the valve, either order longer stems to accommodate the additional wall thickness, or use the appropriate stem extension above and cut to desired length. The cost will be negligible when compared to a new valve, piping, and labor cost.
