MACHINE SCREWS/MECHANICAL AND PERFORMANCE REQUIREMENTS

	Description	A straight shank fastener for binding metal to metal by going through a hole or nut that is pre-tapped to form the same configuration as the screw.
	Applications/ Advantages	Machine screws form a fastening superior in strength to spaced thread screws. Zinc yellow screws are popular in electronics applications. Stainless steel machine screws are used in applications which require general atmospheric corrosion resistance, in food processing machinery and refrigeration equipment. Stainless is also superior to steel in withstanding some elevation in application operating temperature while maintaining its strength.

WASHERS/MECHANICAL & PERFORMANCE REQUIREMENTS

EXTERNAL TOOTH

	Description	A hardened circular washer with twisted prongs or "teeth" which extend out from the outer edge of the washer.
	Applications/ Advantages	This is the most preferable of all tooth-lock washers. It offers the greatest locking efficiency since the teeth are on the largest radius and provide greater torsional resistance.

INTERNAL TOOTH

	Description	A hardened circular washer with twisted prongs or "teeth" which extend inward from the inside edge of the washer.
	Applications/ Advantages	This is preferred when finished appearance is crucial and the teeth must be hidden under the head of the screw; also recommended for use with small heads such as fillisters.

REGULAR & HIGH-ALLOY SPLIT

	Description	<p>Regular: A coiled, hardened, split washer with a slightly trapezoidal wire section.</p> <p>High-Alloy: Dimensionally identical to a regular split lock washer but made from 4037 alloy steel.</p> <p>Stainless: A regular split lock washer made from austenitic stainless steel.</p>
--	--------------------	---

USS FLAT

	Description	A thin, flat, circular steel part with a centrally located hole.
	Applications/ Advantages	Washers are designed for assembly around a bolt or screw, between the bearing surface of the fastener and the part to which it is attached. Flat washers are used to improve stress distribution, and to span large clearance holes. USS washers are designed to meet the majority of industrial applications in manufacturing, maintenance and repair.

SAE FLAT

	Description	Similar to a USS washer, but with slightly smaller inside and outside diameters. Also, most but not all SAE washers are made from thinner materials than USS washers.
	Applications/ Advantages	SAE washers were designed to serve similar purposes as the USS washers, but specifically to meet the requirements in the field of automotive engineering.

SELF-TAPPING SCREWS - THREAD FORMING - TYPE A

	Description	A thread forming tapping screw with wider spaced threads than a Type-AB and a gimlet point.
	Applications/Advantages	For self starting in thin (.015-.050 thick) metal or resin-filled plywood. 18-8 Stainless steel tapping screws may be used in applications which require general atmospheric corrosion resistance. Fastening stainless steel parts to aluminum or steel can cause a type of corrosion known as galvanic couple in some environments.

SELF-TAPPING SCREWS - THREAD FORMING - TYPE-AB

	Description	A thread forming tapping screw with spaced threads and a gimlet point.
	Applications/Advantages	For self starting in thin metal or resin-filled plywood. Recommended over a Type-A, particularly in brittle materials.

SELF-TAPPING SCREWS - SELF-PIERCING

	Description	A slotted hex washer head thread forming tapping screw with a single lead thread rolled to the tip of an extra sharp point, and a second thread spaced 180° apart.
	Applications/Advantages	May be used in thin metal (less than .050 thick). Eliminates need for pre-drilled or pre-punched holes. Undercut area beneath the head allows greater length of thread engagement. Twin lead threads help to reduce driving torque.

MECHANICAL & PERFORMANCE REQUIREMENTS HAMMER DRIVE ANCHOR

	Description	A two-piece fastener consisting of a tubular stem with a dome or flat-flister shaped head, and a nail which is driven through the hollow center of the stem of the anchor. The stem is slit longitudinally on opposite sides from the bottom of the shank to the place where the point of the nail extends into the stem.
	Applications/Advantages	Hammer drives are considered to be light-duty anchors. They are designed for attaching termination bar to solid concrete, solid brick, block or masonry walls. Its advantages include ease of installation, its immediate loading capabilities and the tamper-resistant nature of the finished assembly.

STEEL HOLLOW WALL ANCHOR

	Description	A three-piece fastener consisting of (1) a cylindrical expander shell with longitudinal sections of its shank removed - this design allows the shell to be pulled toward the head and form anchoring legs on the blind side of the assembly. The shell has a threaded opening at one end and a flanged collar at the opposite end with an opening sufficiently large enough to allow a screw to pass to the threaded opening. the flange of the collar has prongs which dig into the bearing surface at the front end of the assembly; (2) a combo-drive pan head screw; (3) either a fiber or steel flat washer.
	Applications/Advantages	Steel hollow wall anchors are considered to be light-duty anchors. They require a pre-drilled hole and may be used in drywall, sheetrock, plaster or paneling. When properly installed, they will not crack or crumble the wall material and resist vibration. The machine screw may be removed and inserted multiple times to accommodate an exchange of fixtures.

PLASTIC HOLLOW WALL ANCHOR

	Description	An injection-molded anchor with a ribbed shank which resists "backing-out" after installation, and longitudinal slits along the shaft which allows the anchor to expand when a screw is inserted.
	Applications/Advantages	Plastic anchors are a more economical, light-duty part than steel hollow wall anchors. They can be used in sheetrock, plaster, brickwork, concrete or tile. The design of the collar allows plastic anchors to also be used in hollow materials. For use with self-tapping or wood screws.

LAG SCREW SHIELDS ANCHOR

	Description	A two-piece assembly made of two semi-cylindrical hollow sections interlocked at the top, allowing the shield to expand when in place. The bore of the shield is tapered, has an internal thread for about 2/3 of the length from the bottom, and a ribbed outer surface which resists "backing out" of the hole into which it is inserted.
	Applications/Advantages	Lag Shields are medium-duty anchors. Extra-long sizes are for use in mortar or brick. Standard lengths are intended for use in concrete.

Acorn Folklore

According to legend, the acorn symbolizes how large accomplishments can spring from the smallest inspiration. May ours be a reminder to you that mighty things can come from the humblest of beginnings.

"Keep thinking. Keep interested. Keep praying. Keep dreaming."

To all our distributor suppliers, contractor users, representative sellers and loyal friends...

Thank you.
