

# 280<sup>TM</sup>

# HEAVY DUTY

# CARTRIDGE DUAL SEAL

## SEAL INSTALLATION

### Preparation

**Determine if the pump is in good condition.**

#### A. Check the shaft or sleeve.

1. Remove all burrs and sharp corners, especially in areas where the O-ring has to slide. Cover threads and keyway slots with a thin tape to prevent cutting the O-ring. The distance from the stuffing box face to the center of the O-ring groove is approximately: 1.50" (38,1 mm) for 1.000" through 2.500" (25 mm through 60 mm); 2.00" (50,8 mm) for 2.625" through 4.750" (65 mm through 120 mm); 3.00" (76,2 mm) for 5.000" through 8.000" (130 mm through 200 mm); 4.00" (101,6 mm) for 8.250" through 12.000" (210 mm through 300 mm).
2. The shaft finish should be 32 microinches RA (0,8 microns) maximum. It should feel smooth if you run your fingernail down it axially.
3. **Make sure the shaft or sleeve diameter is within +/- .002" (0,05 mm) of nominal.**
4. Use a dial indicator to measure the shaft runout in the area where the seal is to be installed. (**Readings should not exceed .001" (0,03 mm) TIR per inch of shaft diameter.**)
5. Place the dial indicator on the end of the shaft and alternately push and pull the shaft axially to measure end play. End play should not exceed .005" (0,12 mm) TIR.
6. Protect the sleeve O-ring by lubricating the shaft with a clean silicone based lubricant, as that provided with the seal.

#### B. Check the stuffing box.

1. The stuffing box face must be a maximum of 125 microinches RA (3,2 microns) for a gasket to seal.
2. Split case pumps will sometimes cause a step (misalignment) to occur on the stuffing box face. This step must be machined flat.
3. Make sure the stuffing box is clean and clear along its entire length.
4. If possible, attach a base dial indicator to the shaft and rotate both the indicator and shaft slowly while reading the runout of the stuffing box face. Misalignment of the stuffing box face relative to the shaft should not exceed .005" (0,12 mm) TIR per inch of shaft diameter.

### Installation

1. Check the chemical listing to determine if the o-rings installed in this seal are compatible with the fluid being sealed.
2. The 1/4 dog point set screws go into the small holes in the sleeve. Do not disengage these screws from the sleeve when positioning the seal. The cup point set screws go through the larger holes in the sleeve. Make sure all screws are engaged in the sleeve but do not protrude into the ID bore. Also, when repositioning or removing the seal, make sure the centering clips and socket head cap screws are engaged.
3. The centering clips have been preset at the factory. If for any reason you loosen or remove the centering clip cap screws, re-tighten each cap screw finger tight (approximately 15 inch-pounds [1,7 Nm] of torque). **Make sure that the lip on the end of the centering clip is inside the gland groove.**
4. **CAUTION:** If the seal is operating at a stuffing box pressure over 300 Psig (20 bar g) or the shaft is case hardened, replace the 316SS cup point set screws with the hardened steel cup point screws supplied with the seal.
5. Slide the seal onto the shaft making sure the 1/4 dog point set screws are engaged through the seal sleeve.
6. Reassemble the pump and make necessary shaft alignments and impeller adjustments. The impeller can be reset at any time, as long as the centering

clips are in place and the seal set screws are loosened while the shaft is being moved.

7. Orient the barrier fluid connections to the location required. The ports are plugged prior to shipping. Remove plugs.
8. Piping connections should not be made prior to tightening the gland bolts.
9. Tighten the gland bolts evenly.
10. **IMPORTANT: The gland bolts must be tightened before tightening the set screws onto the shaft.**
11. **IMPORTANT: All 1/4 dog point set screws must be tightened FIRST.** See figures 1 and 2 below for location of dog point set screws. If rotation of the lock ring is required for tightening set screws, loosen or remove one centering clip. Finger tighten each 1/4 dog point set screw by twisting the short end of the hex key with your finger tips. Then tighten each 1/4 dog point set screw per the recommended tightening torque shown on the chart at the bottom of page 2.
12. Once the 1/4 dog point set screws are tightened, finger tighten each set screw by twisting the short end of the hex key with your finger tips until the point of each set screw touches the shaft. Then tighten each set screw per recommended tightening torque shown on the chart at the bottom of page 2.
13. Remove socket head cap screws and centering clips. Retain for later use.
14. **IMPORTANT: It is important to make sure that the gland is properly centered over the sleeve.** To do this, turn the shaft by hand to make sure the seal turns freely. If you hear metal to metal contact within the seal, it was improperly centered. Replace the centering clips finger tight, loosen gland bolts, tighten clips, re-tighten gland bolts, and then remove clips. If metal to metal contact still exists, check the centering of the stuffing box.

## SEAL INSTALLATION

14. Piping connections should not be made until the gland nuts are tightened.
15. The **BARRIER FLUID CONNECTIONS** are 1/4" NPT for 1.00" through 1.50" (25 mm through 38 mm), 3/8" NPT for 1.625" through 2.50" (40 mm through 60 mm), 1/2" NPT for 2.625" through 8.00" (65 mm through 200 mm), and 3/4" NPT for 8.25" through 12.00" (210 mm through 300 mm).
16. This seal is equipped with a pumping device to circulate the barrier fluid.  
*(The piping connections are dependent on shaft rotation.)*  
Direction of shaft rotation is determined when looking at the lock ring end of the seal.

### Convection

(when ports are positioned at 12:00)

#### A. COUNTER-CLOCKWISE shaft rotation

The cool fluid from the bottom of the convection tank enters through the right port.  
The hot fluid exits the seal through the left port and goes to the top of the convection tank.  
Add fluid, typically 50/50 ethylene glycol and water or Chesterton 610 Synthetic Lubricating Oil, to the convection tank.

#### B. COUNTER-CLOCKWISE shaft rotation

The cool fluid from the bottom of the convection tank enters through the left port.  
The hot fluid exits the seal through the right port and goes to the top of the convection tank.

Add fluid, typically 50/50 ethylene glycol and water or Chesterton 610 Synthetic Lubricating Oil, to the convection tank.

### Forced Circulation

(when ports are positioned at 12:00)

#### A. COUNTER-CLOCKWISE shaft rotation

The cool fluid enters through the right port.  
The hot fluid exits through the left port.

#### B. COUNTER-CLOCKWISE shaft rotation

The cool fluid enters through the left port.  
The hot fluid exits through the right port.  
Take all necessary precautions and follow normal safety procedures before starting equipment.

up to 12.00" (300 mm)	None	290-310 in-lbf (32,8-35,0 Nm)	As required

## CAUTIONS

These instructions are general in nature. It is assumed that the installer is familiar with seals and certainly with the requirements of their plant for the successful use of mechanical seals. If in doubt, get assistance from someone in the plant who is familiar with seals or delay the installation until a seal representative is available. All necessary auxiliary arrangements

for successful operation (heating, cooling, flushing) as well as safety devices must be employed. These decisions are to be made by the user. The chemical listing is intended as a general reference for this seal only. The decision to use this seal or any other Chesterton seal in a particular service is the customer's responsibility.

## PARTS IDENTIFICATION

### STANDARD MATERIALS\*\*

#### All Metal Parts:

- 316 SS.

#### Springs:

- Hastelloy C\*

#### O-Rings:

- Fluorocarbon, FEPM or EPR installed

#### Rotary Face:

- Carbon, Silicon Carbide, Tungsten Carbide

#### Stationary Face:

- Silicon Carbide, Tungsten Carbide

#### Speed:

- To 4000 FPM (20 mps).

#### Pressure:

- To 600 psig (40 bar g) inboard, 250 psig (17 bar g) outboard, up to 4.75" (120 mm) shaft size.
- To 300 psig (20 bar g) inboard, 200 psig (13 bar g) outboard, up to 12.00" (300 mm) shaft size.

#### Temperature:

- To 300°F (150°C) Ethylene Propylene,
- To 400°F (205°C) Fluorocarbon, FEPM,
- To 500°F (260°C) Perfluoroelastomer.

#### Minimum Barrier Fluid Pressure:

- 30 psig (2 bar g) minimum barrier fluid pressure is recommended to properly lubricate outboard seal.

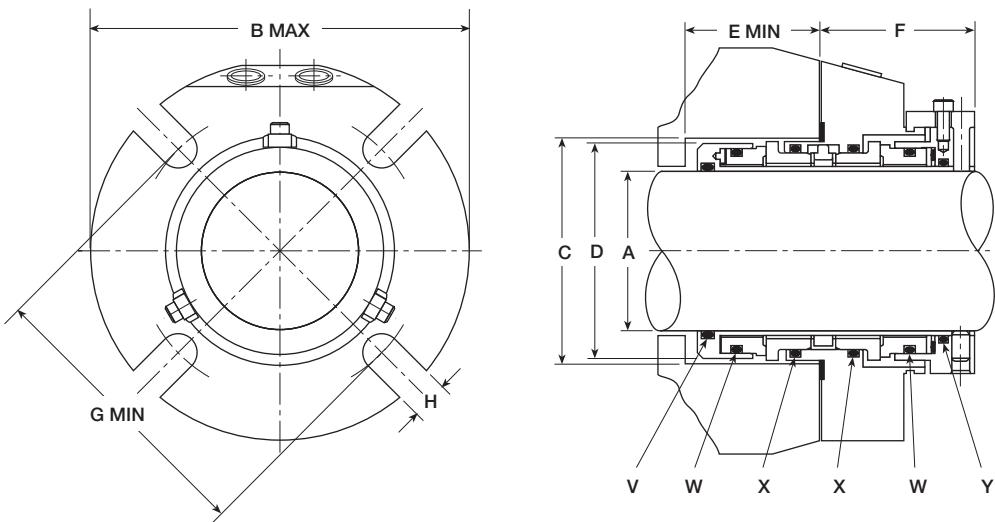

\* Hastelloy is a registered trademark of Haynes International, Inc.

\*\* Other materials available upon request.

#### KEY

1 - Gasket	13 - Gland
2 - Lug	14 - Socket Head Cap Screw
3 - Stationary Face	15 - Centering Clip
4 - Rotary Face	16 - 1/4 Dog Pt. Set Screw
5 - Follower Assembly	17 - Lock Ring
6 - Sleeve Assembly	18 - Set Screw
8 - Spring	V - Shaft O-ring
9 - Rotary Gasket	W - Rotary O-ring
10 - Channel	X - Stationary O-ring
11 - Channel Clip	Y - Lock Ring O-ring
12 - Port Plug	

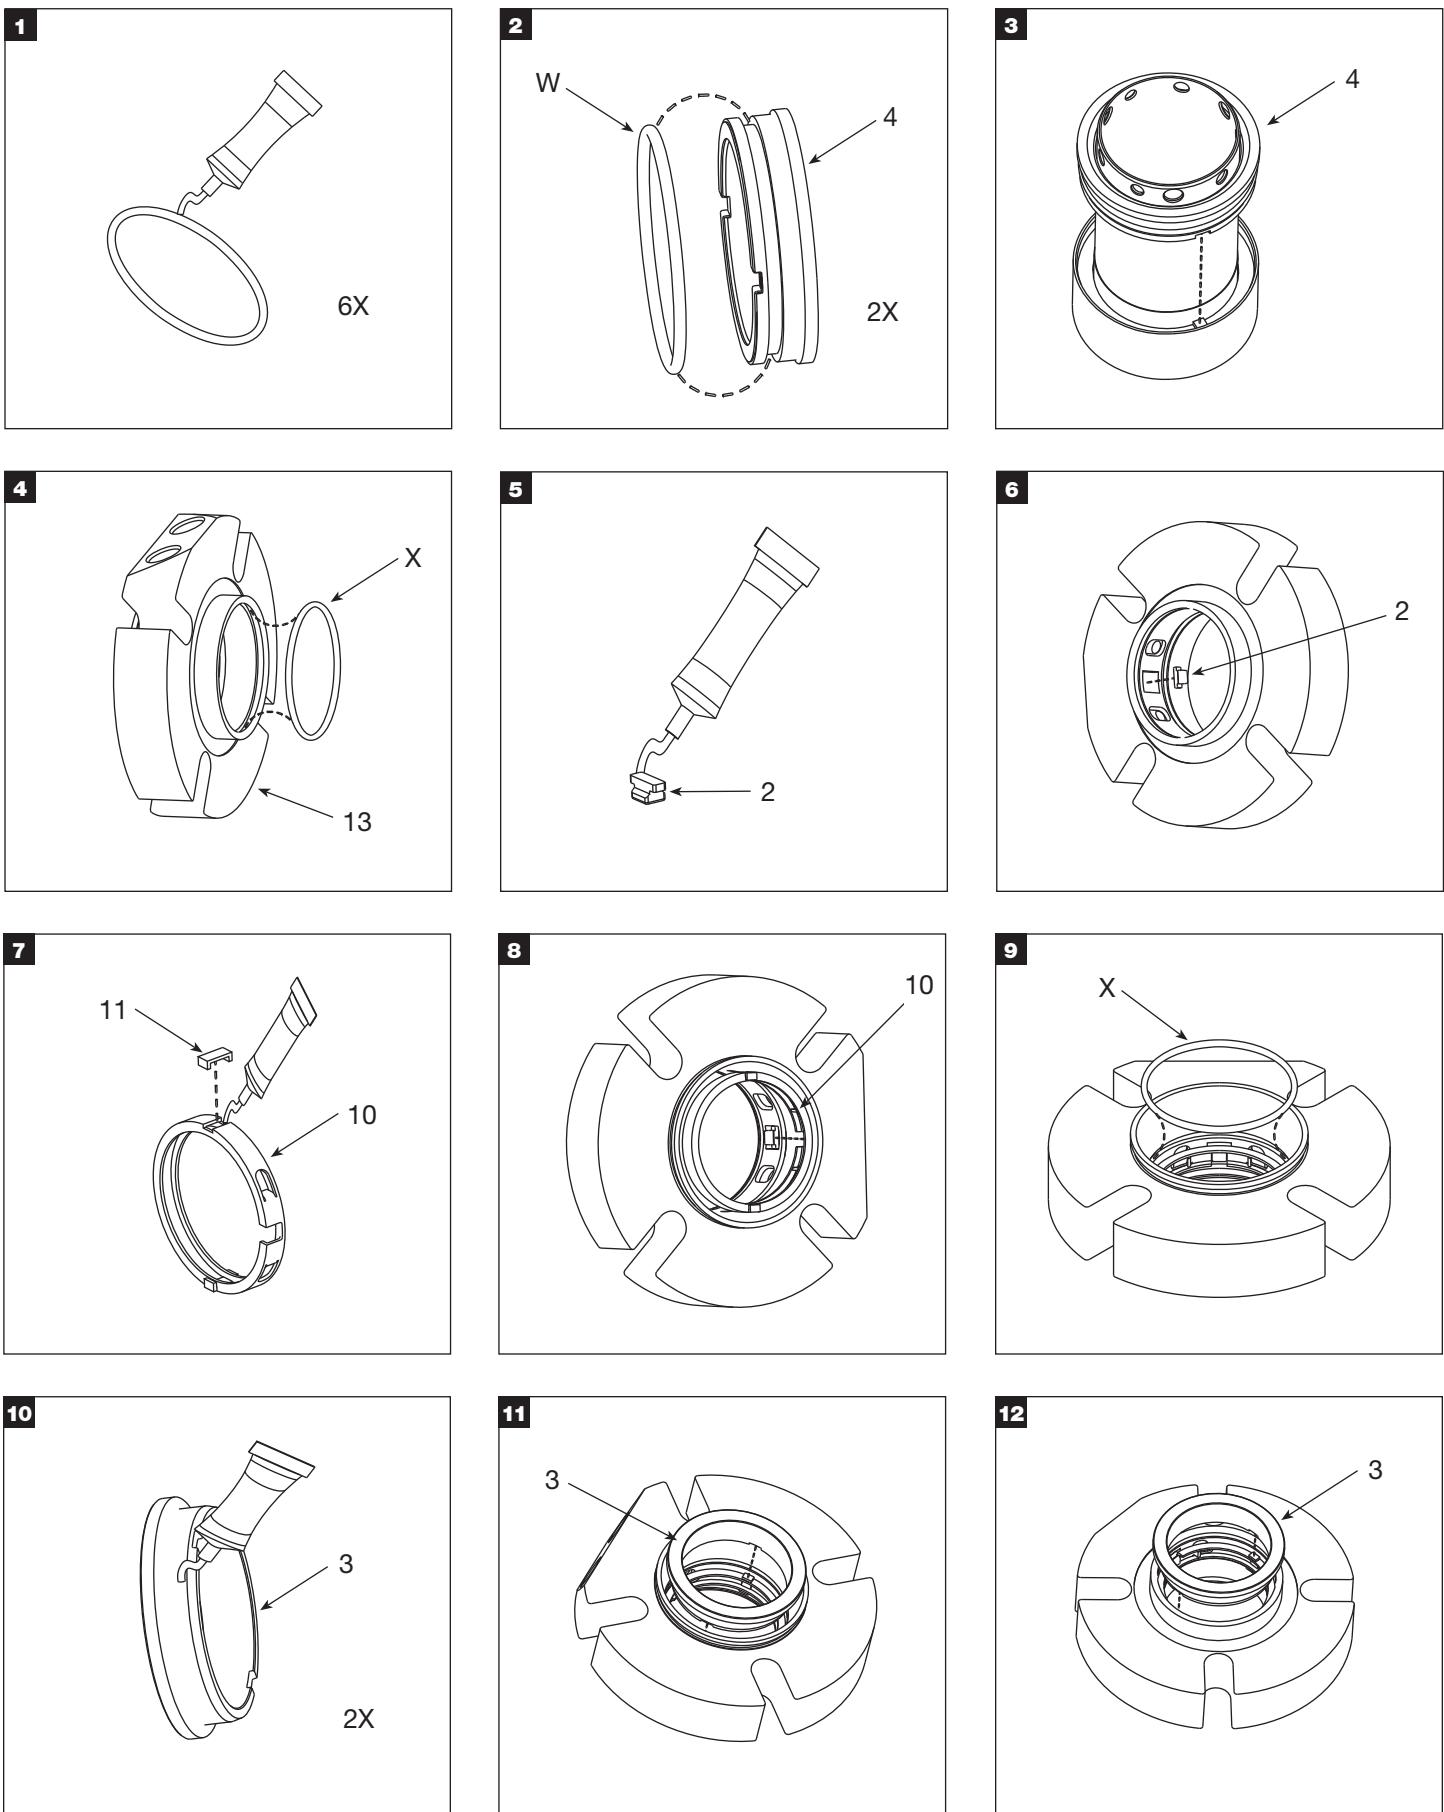

## 280 STANDARD DIMENSIONAL DATA (INCH)

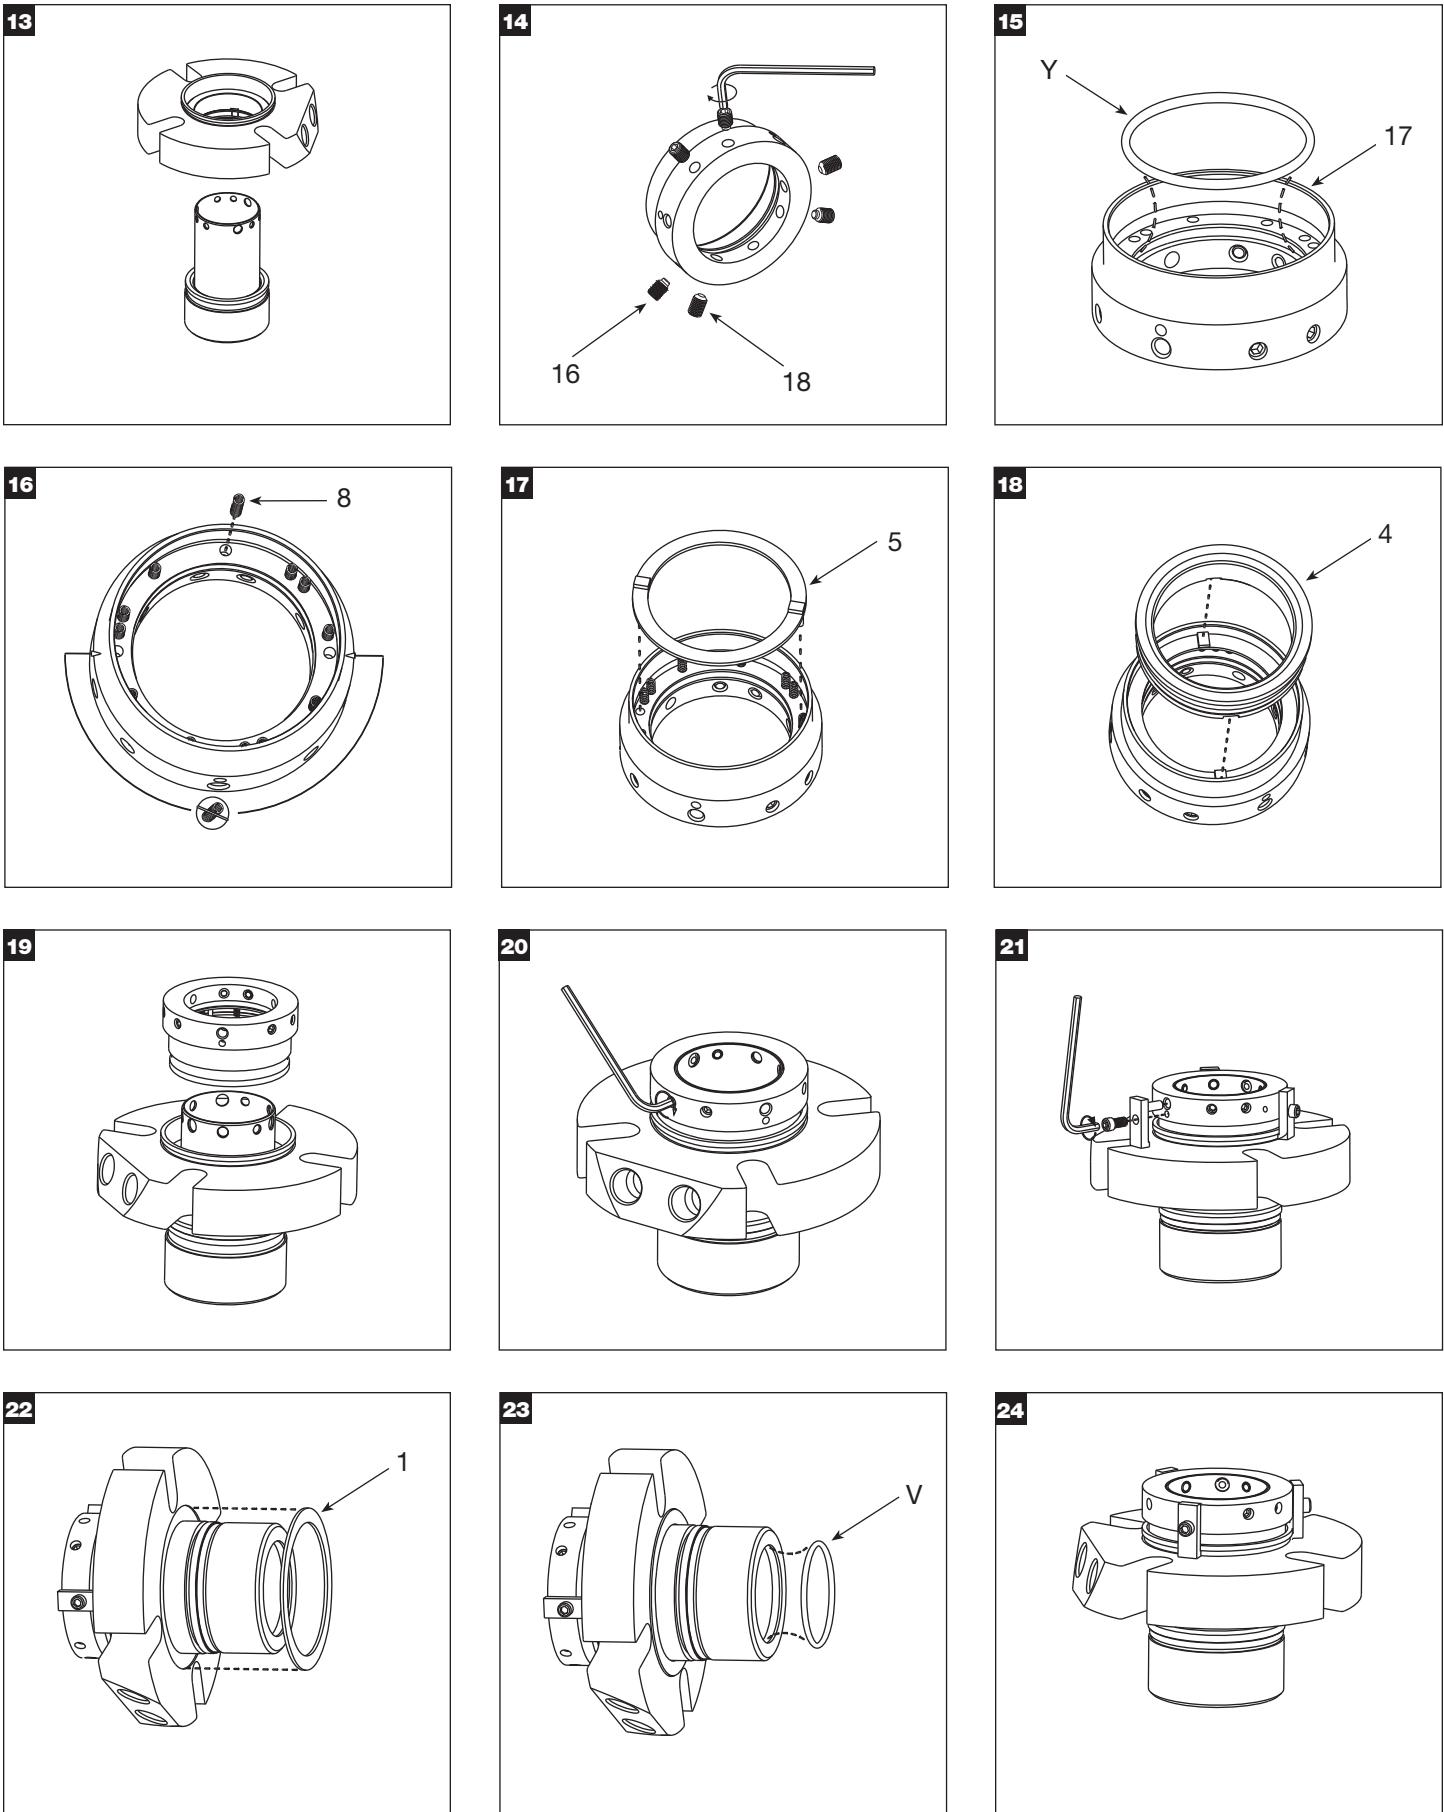

#### KEY

A - Shaft Size
B - Maximum Gland Diameter
C - Stuffing Box Inside Diameter
D - Seal Diameter in Stuffing Box
E - Minimum Stuffing Box Depth
F - Outboard Seal Length
G - Minimum Bolt Circle by Bolt Size
H - Slot Width
V - Shaft O-ring
W - Rotary O-ring
X - Stationary O-ring
Y - Lock Ring O-ring

**KEY**

- A - Shaft Size
- B - Maximum Gland Diameter
- C - Stuffing Box Inside Diameter
- D - Seal Diameter in Stuffing Box
- E - Minimum Stuffing Box Depth
- F - Outboard Seal Length
- G - Minimum Bolt Circle by Bolt Size
- H - Slot Width
- V - Shaft O-ring
- W - Rotary O-ring
- X - Stationary O-ring
- Y - Lock Ring O-ring
