

## Whole House Post-filter cartridge replacement

The post filter removes particulates 60 times smaller than the eye can see. This includes insoluble minerals and cysts. The addition of this post filter is considered a polishing agent and adds a level of protection for your household in the event of an outbreak of cryptosporidium or giardia. The filter is changed out every 9-12 months.

### How to change the filter:

- Shut filter system off at the shut off valve (A). Relieve pressure in the water line by running water for 2-3 minutes at the nearest faucet.
- Press the pressure release button (B).
- Place a bucket under the post filter to catch water. Remove the clear container by turning clockwise to loosen, using the wrench supplied with your filter system. Remove the used filter.
- If necessary, clean the inside with mild soapy water, rinse and dry.
- Replace with a new pleated replacement cartridge.
- Ensure the clear container has the O-ring in place under the threads (C). This ensures no leaking.
- After reassembly, turn the system back on at the shut off valve.
- Run water, with the bucket still under the post filter. Check for leaks.
