NEW YORK WIDESPREAD FAUCET INSTALLATION

INSTALLATION

1. Ensure that the water supply below your sink is completely shut off by turning the valve all the way to the right.

Tip: Place a small bucket below your workspace to catch any water that may drip during the installation process.

2. Remove the T-connector, lock nut, and metal washer from the faucet spout.

3. Set the decorative escutcheon over the center faucet hole, then set the spout into the hole.

4. From beneath the countertop, slide the metal washer back onto the threaded shank. Hand tighten the lock nut, then finish tightening using an adjustable wrench.

Important: The opening on the metal washer should face the back of the faucet so that it will line up with the hole in the spout that is reserved for the drain's lift rod.

5. Reattach the T-connector to the end of the threaded shank by hand tightening. Apply plumber's tape or thread sealant to the threads before tightening. Ensure that the inlets of the T-connector and pointing to the left and right.

6. The faucet's valve stems are labeled by colored plastic washers – blue for 'cold' and red for 'hot.' On the 'cold' valve stem, loosen the lock nut to its furthest point at the bottom of the stem.

7. From beneath the counter top, insert the valve stem through the right-side faucet hole. From above the counter top, thread one of the two bell flanges to the stem until hand-tight.

8. From beneath the sink, position the stem so that the outlet on the side of the stem is pointing inward, towards the T-connector. While holding in place, hand tighten the lock nut. Finish tightening using a basin wrench.

9. Repeat steps 6-8 to install the 'hot' valve stem into the left-side faucet hole.

10. Use the provided braided water lines to connect the hot and cold valve stems to the T-connector. Use an adjustable wrench to tighten, but be careful not to overtighten. Apply thread sealant or plumber's tape to each threaded connection before attaching.

11. Attach the faucet handles to the valve stems, as shown.

12. Connect the main water supply lines to the valve stems. Apply plumber's tape or thread sealant to the threads before tightening. Turn the faucet on and allow the water to flow for approximately 60 seconds. Ensure that there are no leaks, and that both hot and cold water are running properly.
